JAMES THIN, PUBLISHER TO THE UNIVERSITY LONDON: SIMPKIN, MARSHALL & CO. 1893

PREFACE.

3

I HAVE been told and believe that a book written on the lines of the present one is a desideratum.

Certainly, if a correct knowledge of the whence and the wherefore of words have its uses, no one who wishes or is constrained to be a full man in such things can afford to dispense with a knowledge of the facts that I have here tried to set forth.

It has been my object to produce a volume that will, with fair completeness, and in moderate compass, present the main results of modern phonology. I have also sought to round it off by the addition of such supplementary matter as may usefully accompany the main theme.

Phonology is a precise science, as precise as the most fastidious precisian could desire. It is based on truth, it is buttressed by law. If it has its farthing facts, it has also its solid generalisations. In any case, it is indispensable in linguistic research, which, involving as it does a knowledge of principle, ought to be appraised above mere dictionary etymologising.

I trust that this book will be found useful by any one who wishes to devote some time and attention to the former.

I have built mainly on Brugmann and Sweet. Mr. Mayhew's Old English Phonology and Mr. Wharton's Etyma Latina I have found very helpful. To all Mr. Skeat's books, lucides direct help, I owe much in the way of momentum. Many contributions to the American Journal of Philology have given me assistance. I think I have generally acknowledged direct help. At all events I cite my authorities. I must not forget to mention how much I have profited by a perusal of Strong's translation of Paul's Phinciples. From Wheeler's pamphlet on Analogy I have got many hints and illustrations.

That this book is free from blunders I have not the presumption to hope. There must be in it many traces of extymological abergiands. If would be an easy thing to describe it as consisting of bits of etymological caviare indifferently dressed. With regard to the dressing I plead guilty in advance. It might have been in more competent hands. Commune transes grandia.

\s for errors in execution and detail, I have to say that this book covers a wide field, and that one man's judgment and one pair of eves are fallible.

It will be an advantage to read, or, at all events, to glance at Chapter V., before reading the others. It contains a description of many sound-processes that are assumed in previous chapters.

Special characters are explained at the proper places. Some of them are necessarily used in advance of their explanation. Pages 13, 14, 27, 32, 51, 75, 84, and 93 contant allusions to such characters. I mean the Index to supply cross-references that may only be hinted at and not paged. The English words in Chapters VIII. and IX. are separately indexed.

INTRODUCTION.

THE ARVANS — THEIR CULTURE AND ORIGINAL HOME.
THE ORIGIN OF SPEECH.

This idyllic, but certainly also idealised picture of the ancient Aryans is well known. According to this, they were an agricultural people, and lived the life of simple swains. They possessed towns too, and were not ignorant of the rudiments of fortification. Peace had reigned for a long time in, their land, not the pass Romana of later times, but the peace that is due to a peace-loying temper and a devotion to rural pursuits. Their family life was happy and sweetly reasonable. At the head of the household were the protector of its weal and the manager of its concerns. The members of the family, the milk-maid daughter and the supporter-brother, had all the virtues that are sisterly and brotherly. A drift towards righteousness was everywhere visible, and morality was so elevated as to suggest a serious falling off on the part of descendants.

The undoubted domestication of a few animals, the presence in the various languages of correlates to #\$\text{siz}\$, apater, mater, \$\text{siz}\$, \$\text{siz}\$, \$\text{siz}\$, \$\text{siz}\$, have been made to prove all this, and to answer that \$\text{pater}\$, mater are artificial dressings of the older onomatopoetic lattwister, that \$\text{siz}\$ are is more likely to mean 'guae lactat', or 'guae lactet', than 'the milkmaid,' to insist that transferred meanings of roots are not

to be taken for primitive, nay, that it is not permissible to assume on the part of the primitive people a clear consciousness of the relation between root and full-grown word, is to evince want of imagination, and to qualify for the name of devotee of Darwinism and dirt.

A careful examination of the letter of the data for inference given in language will give us other results, not so taking certainly, nor so flattering to the supreme Caucasian mind, but eminently sensible results, results, too, that are not high-and-dry, but corroborated by conclusions drawn from other sciences.

Some risks have to be guarded against before conclusions can be safely drawn. We must see to it that the word on which we base our argument has a distribution in the languages of the Aryan family sufficiently wide to gain for it the name of primitive, that borrowing has not taken place, that the term applied is not so natural and so plainly suggested by some marked quality in the thing named as to arise independently and at different times, we must take care not to real take and developed meanings into primitive words, and, lastly, we must take care not to draw negative conclusions until we have satisfied ourselves that the word has not once existed and been lost.

It is our inability to fulfil all these conditions that forms one of the chief obstacles in the way of deductions got from a simple analysis of words. To reach the most probable result, assistance has often to be got from many sides, from anthropology, from prehistoric research, from the history of culture. A reconstruction of Aryan culture based, say, on the Indo-European vocabulary in Fick's dictionary, is almost sure to be highly coloured, owing to the fatal facility.

with which we put our own interpretations on ideas that were then in their rudimentary stages.

So much of our knowledge of Aryan life and culture may be got by inferences from language, that some remarks must be made on that topic.

To begin with, it will be well to notice a theory with regard to the location of the Aryans in their original quarters that will affect our view of the relations of the languages and peoples to one another, and guide us in drawing inferences from the facts that language supplies.

In the chapter on Grimm's Law are set down the following remarks on the primitive state of the Indo-European peoples:—'It must not be supposed that the original tribes dwelt as next-door neighbours within circumscribed limits, for they dwelt at long distances, though still in touch with one another. They observed various attitudes towards the sound-norms, had certainly much in common, but were also predisposed to change in different degrees and along different lines. Each family or languages, each system of sounds had its own differencessive.'

These statements assume the truth of the wave or transition theory of Schmidt, approved of by Brugmann, Paul, and Schmider. This theory has supplanted the old or pedigree theory of former writers, according to which there was one homogeneous Urspracke with something approaching to a dead level of uniformity, spoken by one people dwelling together in unity of speech-sound and speech-bent, from whom there hived off swarms, which, on geographical disjunction, began to develop differences in language that separated them from the other members of their stock, swarms, however, which tall comortised two or

more peoples that for a long period were linguistically one.

To the pedigree theory belonged peculiarly the hypothecer of Italo-Graceo-Celtie, Graceo-Latin, and Lithus-Slavo-Tentonic periods, characterised by identity of language, including the common possession of differentiations of the primitive homogeneity.

According to the transition theory, a primitive Indo-European homogeneity, in the sense we attach to an original Teutonic homogeneity, never existed. Characteristic differences of individual languages existed then in some shape, in fact the primitive peoples were not so packed shoulder to shoulder in their original quarters as to present the conditions for the alleged sameness. Settled as they were at considerable distances from one another, though with facility of intercourse, dialectic differences would be accentuated and evolved in in many parts of the territory occupied. These spread, according to the laws that regulate the diffusion of dialectic changes and creations, in waves or undulations, as the theory puts it, over the neighbourhood in which the nidus there had made for themselves was located.

To realise this, let us suppose the sites for the Aryan peoples set down, with some rough semblance of their present relative positions preserved, in one plan on a minute scale. This will give us some idea of the geographical area on which Teutons, Slavo-Lithuanians, Celts, Italians, Greeks, Indo-Iranians, and Armenians lived together before the dispersion. The spaces between were occupied by transition dialects ('kontinuierliche Vermittelung') which gradually shaded off into one another and into the main languages that bounded them. These have died out with .

little or no record, and left the abrupt transitions we now encounter.

There are many missing links in language which, if recovered, would infallibly give us more light, and possibly
give another complexion to established theories. We have,
for instance, no remains of the tongues that were spoken
north of Hellas. The Phrygians are said to have come
from Thrace, and, if it be true that the Armenian language
is descended from Phrygian, we may consider that it contains certain of the links between Greek and Slavonic on
the one hand, and Greek and Indo-Iranian on the other,
that must have abundantly appeared in Thracian and
Phryvian.

Again, when we remember that Armenian contains all the changes of Grimm's Law, we are entitled to suppose that the tract in which its progenitor was spoken was in touch with the Teutonic some.

It is also permissible to believe that Albanian, as the representative of old Illyrian, forms a link between Greek and Latin.

The wave theory satisfactorily solves contradictions that were presented by the pedigree theory. Not all that was advanced by it could be true. If Greek, a European language, offers such strong resemblances to Indo-Imaina as to warrant from the old point of view the assumption of an Indo-Persico-Greek period, we cannot at the same time lave our cut-and-dry European period with a common language.

But the new theory makes it possible for us without contradiction to grasp the possibility of Greek having many strong resemblances to Indo-Iranian, and at the same time manifesting points of connection with Latin, because the truth of the one does not on this theory destroy the conditions for the existence of the other. It was common in the pedigree theory on the strength of like phenomena to groupseveral languages together, and postulate a common original language, ignoring all the while points of similarity on this side and on that, which argued a wider connection, and militated nearist the existence of a loint language.

There are three classes of resemblances that may obtain between languages, resemblances due to geographical proximity and brought about by natural or political causes, or by the disappearance of some barrier; resemblances that are part of the original inheritance; and resemblances that may be called frontier resemblances, due to contact with various neighbours at various points. The first of these may be such as to justify us in assuming a period of common culture for the peoples concerned. A common language in the strict sense is not to be thought of, for all these allied languages were dialects from the beginning.

One then of the defects of the pedigree theory was its inability to furnish a good-going explanation which would be elastic enough to account for facts all round. For instance, Sanskrit has an a where all the European languages, includ-Armenian, have e; the palatal guttural has been assibilated in Sanskrit and Letto-Slavonic, e.g., Sk. tatam, (cp. L. cantum), the $b\bar{b}$ of the plural case-suffix seen in Gk. -pn, L. bus, has in Teutonic and Letto-Slavonic become m (assuming m to be a manifestation of the $b\bar{b}$ suffix), e.g. AS., dat and instrum. plu. in -m; Celtic and Latin are unique in presenting r in the passive; Latin and Greek have all to themselves feminines in $s\bar{s}$ and $s\bar{s}$.

The padigree theory never submitted anything that could suisfactorily explain, at one and the same time, not one, but the whole of these facts. The e of European languages is undoubtedly part of the original inheritance, the Sk. a being of different values, or due to levelling.

The other resemblances come under the head of frontier resemblances. There were zones where such and such influences were at work and prevailed. A careful consideration of the theory ought to make all these points clear.

Another defect of the pedigree theory, and its twin, the original-identical-language theory, was the failure to recognise that the almost perfect uniformity in language some of its presentations seem to assume never existed. Keeping in mind Paul's dictum that there are as many dialects as individuals, we may say that there were certainly as many dialect-languages as peoples, and that a working uniformly is all that can be postulated of the tongue of peoples who, though originally one, tenanted a wide area, to the number of seven, and these too, the founders of languages that were subsequently quite distinct though cognists.

The further back, the greater the uniformity, though there was never identity. The habits of ex-nomads who had cantered on the pastoral stage are not favourable to the existence of the packing in space that identity in language requires. A common language is a late product, the creation of the newspaner, fashion, and the schoolmaster.

As to the amount of sameness in the languages before dispersion, that is a matter of inference from observed data. They would all be inflectional in caste, and have in common much of the usual inflectional machinery.

The extent of the common vocabulary may be inferred

from the stock of words which an examination of the common culture yields. In the case of men fighting to a large extent with nature an exuberant vocabulary is not to be thought of. A knowledge of the sound-system is to be gleaned from an examination of the sounds transmitted to us, plus an acquaintance with what is antecedent and sub-

sequent in sound development.
Which is the most archaic of the Aryan languages?
Which has preserved most of the common characteristics of
the tongue of the original people? Well, we have not the
data to answer the question, and its importance is not pressing. To come to a satisfactory decision we should require
contemporaneous records of the languages compared. So
far as vowels are concerned, Greek has been very conservative. There can be no doubt that Sanskrit in structure is

more primitive-looking than the other languages. That it has a monopoly of archaic traits is as undoubtedly false. We may be sure these are pretty evenly distributed.

Attempts to reconstruct the original tongue from the

evidence of language are badly lamed by the facts revealed in the theory we have tried to describe. When a word is missing from a language, no man can with certainty say whether it has disappeared, or whether it ever existed. On the old assumptions, the method was easy, if also rough and ready, for, starting with a common European language, if a word occurred in Sanskrit and in one European language, the others must have lost the heirloom.

If linguistic evidence alone is to be relied on, the more the languages in which a word occurs, the stronger the probability of its being original. Even then there are such thiags as accidental coincidences. There may also be coincidences that cannot be called accidental, for the very fact that there is such a thing as an Indo-European family of languages implies, as regards constituent peoples, an amount of sameness in mental equipment and tendency that ought to be reflected in the languages.

After these general remarks, it will be proper to discuss in order the divisions of the heading.

In the following pages I shall rely chiefly on Schrader. The first of the divisions is the culture of the Aryans. It is necessary to ascertain this with all possible aids, and use all the light so got, to clear up the moot-points of the question.

It will be convenient in writing on this division to handle matters in the order (1) of material arts and material advances, and (2) of social progress and intellectual conceptions.

In the first sub-division are to be handled facts that have a bearing on metals and weapons, on agriculture, on dwellings, on clothing, on food and drink, and on trade.

In the second is to be estimated the significance of names of kin, of ideas about the gods and the hereafter, and of the mode of computing time.

In quoting words I shall, as a rule, give the Sanskrit, Classical, and Teutonic equivalents where these exist. In this introduction I shall, when quoting German, usually give the New High German, and not the Old High German couivalent.

The discovery of metals simply meant salvation to man. With their aid he could face up to nature, and clear away the vast and rank growth of forest that fettered his movements, with their aid he could assert his superiority, and cope with the numerous and aggressive wild-beasts that made life hitter.

Being now, in proportion to his skill, better able to minister to his material wants, he would be drawn by the greater leisure at his disposal, and the hope of still further perfecting his tools, to work towards that point in weaponmaking, in which increase of shapeliness means increase of utility. To the quest of shapeliness would be added the desire for grace, and to grace the rudiments of the artistic sense.

When those men who had become workers in metal in a small way, to supply most effectively their needs, heard of the more highly favoured mortals in other parts, to whomnature had gifted store of metals for use or ornament, they made shift to procure these.

These efforts were the beginning of trading. Metals would be sure to acquire a representative value, and the passage of the standard of value from pecudes into pence gave to trading the facility and expansiveness that its spread required.

Whatever may have been the metals known to the Ayrans, there is no general terms for metals among them, nor indeed among the separate peoples. The name of the metal first discovered was used as a general term. Mirex\(\text{lost}\) and metallum are vonds of late development, derived, it is said, from a Semitic verb meaning 'to smithy,' an origin due to the fact that the Phenicians crected smelting-houses beside the mines they dug.

There are also no terms common to the Indo-European

Inaguages denoting the smith or his craft, not even among the Indo-Iranians, where so much else is common, though such terms do exist in the separate dialects of families, unless some one can conjure something out of Sk. diman, Gk. äxwan, zájüx; L. caminux, A.S. hamor (E. hammer). All originally meant stone, and seem (assuming them to be cognates) simply to prove that stone implements were used, not that smithying proper was practised by the original people.

Nor will a grouping of the facts connected with the smith-lore of the various peoples, plentiful as they are—for smiths and smithying played a large part in the imaginations of the northern peoples, now ranked with the divine now with the diabolic—enable us, in default of aid from language, to predicate original primitiveness of the smith or his craft. In spite of analogies between the stories of Hephaestus woll-aveolism and Wieland Minkelein, in spite of the appearance, both in south and north, of giants and dwarfs as workers in metal, in spite of the attribution to these workers in both areas of skill in the musical and the healing arts, one is constrained to deny common inherited elements, and partly owing to the very resemblances to suspect myth-borrowing with local colouring on the part of of the Testons.

Of the individual metals, we may at once say that gold was not known to the Aryans in their joint state. One has only got to think on zyosé; and aurum to come to some such conclusion. With zyosé; Goth, gulp, A.S. gold used to be connected, but that cannot possibly be, even on the supposition that zyosé; zyorjé. Sonant I is not represented in Greek by pê. Beside gulp, however, stands a

Manual of Linguistics.

xxvi

Slavonic cognate. X1006; has been equated to Sk. hiranyam, but, apart from other difficulties, there is not agreement in the suffix.

It is simpler to call *\(\textit{Z} \) yessi: a loan word from the Semitic (cp. Hebree chārārā.). We know that the Phoenicians were the first to work the gold mines of Thrace, and that in the gray antiquity of the fifteenth century r.c. So that the use of *\textit{Z} yessi; in the manufacture of personal and place names, always a mark of age, is sufficiently accounted for. The Semitic peoples were acquainted with gold, owing to their many points of contact with Egypt, a land rich in gold from time immemorial. Gold, too, was plentiful in Asia Minor and Arabia.

It is of course possible that the Greeks had gold before they knew the Phoenicians, and either renamed it, or adopted the Toreign term to denote the foreign wrought gold they' got from the Phoenicians. This term may afterwards have been generalised, and have displaced the native term.

The Latin aurum is a name probably drawn from the native vocabulary, and applied to gold on its introduction. The word is connected with aurūva and ūrī, and meant to begin with 'the gleaming thing.'

By a similar step in nomenclature, the Teutons got gulp from the root ghd (ghd), seen in L. helzus, Gk. 2012, G. gelb. Here gulp, to begin with, meant 'the yellow thing.'

The name aurum gives us not the slightest hint whence the Italians first got gold. The Teutons perhaps got their first gold from some of the outlying Turko-Tartaric peoples, who, in their original home near the Altai Mountains, had gold in plenty. The Indo-Iranians, of course, got gold in the sands of their own rivers. The Celtic word for gold comes from Latin, so does the Lithuanian word.

As far as the substance itself is concerned, it is difficult to believe that the Gauls, who, as Polybius says, had store of gold ornaments when they invaded Italy, had to wait till they came into contact with the Italians before they made its acquaintance.

In Norse we have beside gull 'gold in the mass,' belonging to common Teutonic, also eyrir from aurum, meaning coined gold.

What, then, are the facts? The Greek word is borrowed from Semitic, the Latin word stands by itself and fathers words in other languages, the Indo-Innains have a word that is common only to the two peoples, Teut gulf has only a congener in Slavonic—facts all proving that gold was not known till after the dispersion.

Of silver, as of gold, we are entitled to say that it was not known to the Ayrans in their joint state. The Sanskrit word for silver, rajatán, in the Rigveda, has only the meaning of white, and the Zend word is only met with in the Avesta.

In the Iranian languages there is no agreement in words for this term, and surely if the metal had had a high antiquity in these languages, there should have been some common agreement, however isolated, in the names.

At first, on hearing Sk. rajustum, Gk. žeyuse, L. argunum (and an Armenian cognate), one may feel it safe to pronounce for original joint possession, but, inassmuch as the quality that has originated the name is so characteristic of the substance named. we have probably here the

case of a name that would inevitably be coined by observant name-makers. It was probably from Armenia, a country in historical times rich in silver, that the Indo-Iranians got their knowledge of that metal, and the name its importers mentioned in their hearing would fall pat on their ears, and suggest their own. Any two observers would agree in calling silver the white metal.

The Greeks, too, probably got their knowledge of silver from Armenia, and the Italians theirs from Greece, or, it may be, from Spain, where the Phoenicians had long wrought silver mines. If from the former, we may suppose the Greek word to have taken on an Italian suffix.

In Italy, where nature has grudgingly gifted silver, the metal must have been introduced at an early date, for the name is present in more than one dialect.

The Celtic word for silver is possibly a term manufactured on the analogy of argentum, out of an adjective meaning white, seen, perhaps, in Argentoratum, the Celtic name of Strassburg.

The Teutons and the Slavs have a joint term (Goth. silner, &c.). It will be remembered that the term for gold was also common to these two peoples.

Nothing definite is known of the etymology of the word silver. A connection with some adjective denoting whiteness would be the most satisfactory, but Kluge declares the word to be foreign to Indo-Europeans. Tacitus tells us the Germans imported silver, and perhaps, if we knew definitely whence, we might get an explanation of the name. Is it not possible that they got it with the name through the agency of some intervening tribe from the Greek traders on the Black Sea, who of course got it from Amenia?

Words for copper, one of the most widely distributed of metals, were quite generally diffused in early times. The Egyptians had their term, the Semites theirs, and the Turko-Tartaric peoples had also coined a name. One naturally expects to find a term appearing in the Indo-European domain that will prove a common knowledge of copper, and such a term is seen in the equation Sk. dyna, L. car, Goth. dir. Some difficulty has been met with in the attempt to make out copper to have been the original meaning in Sanskirit, but in Latin and Teutonic, it is pretty patent that the original meaning was copper.

If it be right to locate, with Schrader, the original home in the district of the Middle Volga, then the Aryans probably got their knowledge of copper by trading relations with the tribes of the Ural Mountains.

The content of the term for copper was enlarged. In Latin, as elsewhere, the term for copper was afterwards applied to bronze, and in Teutonic, it came to mean ore in general. In Sanskrit, the term was alienated from its original meaning altogether, and applied to iron, while new terms were got for copper, which have no connexion with other Indo-European words.

The fact that the metals accommodating themselves to dyar are neuter in Latin, in Sanskrit, and Gothic, supports the belief that copper was the earliest metal known, a belief that is also countenanced by the fact that many names of iron originally meant copper. Perhaps the new metals were described in terms that referred them to the old, plus a characteristic quality.

Greek is not amongst the languages that furnish an element to the above equation. Probably the term has disappeared, a form like dyas, having in Greek, where both j and s have been lost, small chance of survival.

This leads us to the Greek word for copper. 20.206 with the meanings of copper and bronze existed from of old in Greek. It is used extensively in nomenclature, exhibiting quite a contrast in this particular to offense, but, as far as origin is concerned, stands quite isolated in Indo-Euronean.

In Latin, a precise term was got for copper in the expressions are cyprium. This plainly means 'ore of Cyprus.' This term in the later arprum furnished a word for copper all round—to Celtic, which originally had a word of its own, and to Teurons.

Of bronze, the names for which have so many points of contact with the names for copper, the Indo-Europeans during their joint life probably knew nothing.

Wrought iron is a rather perishable substance, and so we are confined to language for information about its presence, early or late, among the metals known to the ancients.

The Semites have a family name for it, seen in the Hebrew bar(e)set, a fact that argues an acquaintance made before the dispersion of the families of the stock. The Iranian peoples, too, lave a common name.

In Sanskrit, as was remarked above, iron usurped possession of dyas, the term for copper.

Nothing definite can be made of the Greek term of hippor.

That iron was known from an early date the literature proves.

2020/26 certainly had a prior existence—witness its use in

name-making, and in the coinage of a vocabulary of terms in smithery, e.g., ×a2.xev, established before the making of

The difficulty we have in tracing allower does not exist in the case of the word for steel, viz., yzh.r.l. We know that the name of this metal came, with the substance, from the Chalybes who lived somewhere near Pontus.

Latin also has a name for iron all to itself, unless ferrum can be cognated with the Hebrew bar(e)cel. This would make for a Punic or Phoenician origin of the term.

In the details of priestly ritual, bronze is often mentioned, but not iron. From this, it appears that an acquaintance with iron was made at a comparatively late period, and it is just possible that contact with Phoenician traders brought about this acquaintance. At least the iron of Elba ought to have drawn them to that part of Italy.

The Teutons got their name for iron from the Celss. Cesar in the Gallic War describes a tribe of Gauls as possessors of ironworks. Perhaps the Gauls were taught smelting and smithying by the Romans. Gothic eisem, placed beside Ir. iarunn and Welsh hairun, betrays its origin, arm not being a Teutonic suffix. s has dropped from the Celtic forms, which, by the bye, may perhaps be ranked with L. act. &c.

The Letto-Slavonic word for iron has been equated with χαλκός.

The variety of different names possessed by members of the Indo-European family makes it clear that iron was not known in the primitive period. At the same time, the possession of common terms for iron by related peoples, now living far apart, postulates a high antiquity. Indeed, in some areas, there is evidence that steel must have been manufactured at an early time.

Lead and tin, unlike most of the other metals alternately assigned and denied to the Indo-European period, have never been adjudged of such antiquity. Of the following appellatives in familiar languages for the two metals — μολικβοις, plumbum, [εἰκλ, blai; πάκοιτηκο, stannum, tin, sinn—nothing definite is known save of κάκοιτηκος. The Phoenicians were the earliest carriers of tin from Cornwall (σ'. Cassiter Street in Bodmin) to the Mediternanean. We should then expect the word to be of Semitic origin, and the Assyrian kāšasatīras has been thought to be a likely parent.

Suggestions on the origin of the other words will be found in Schrader.

The Slavonic terms are obscure.

The Celtic term for lead, seen in Ir. Intaids, is probably the parent of the Teutonic word. The Celts engaged in mining before the Teutons, and, as we have seen, gifted them the word for iron. They got from L. stannum their word for tin.

The notion that tin was an older metal than lead has been dispelled by Schliemann. Store of lead was found in the prehistoric towns of the Troad, tin in none.

Reviewing then the story told by the metals, we must conclude that the Europeans in their joint state knew none of the metals save copper.

Next, a word or two on weapons. The evidence got from a consideration of the names applied to these, tends but to strengthen the conclusion just announced. There is no good-going Indo-European equation of wide range for weapons. The Irido-Iranians have some common names for offensive weapons, but not for defensive armour. All round indeed, there is a special lack of connexion in the words for defensive armour.

Greek names for weapons are usually conspicuously different from Latin names, exhibiting, however, considerable agreement with Indo-Iranian names. This but increases the evidence already before us for a connexion between Greeks and Indo-Iranians.

In the names given to arms we find no positive proof that metal was used in their manufacture. From the fact that copper is the only need that was certainly known to the Indo-Europeans, this is what we should expect. Most names, on being interrogated as to their origin, reveal simple materials. Take for instance in Greek—δφν (cp. δφν), μελη 'ash and spear,' τέξω (cp. taxus 'yew'), κυίη 'helmet,' orig, 'dog-skin cap'; in Latin—pilum, the same word as pilum 'pestel,' satum (cp. σείνε', 'hide'), lõria' (cp. lõra 'leather thongs'); in Teutonic—A.S. seax 'short sword' (cp. L. saxum), A.S. lind 'shield,' made of linden wood.

Some of the equations that may guide us in drawing inferences as to primitive weapons are Sk. astis; L.
astis; L. arata, Goth. arknowsne 'arrow'; Gk. &Ein, L.
astis, Goth. akwaiz, A.S. eax. An analysis of names, and
the evidence of prehistoric remains permit us to refer to
the joint period the knife-sword, the bow and arrow, the
axe, the club, and the spear. Of course the sling belongs
to it.

Perhaps the commonness of the material used accounts for the sparseness of cognates, and the limited range of the existing ones. The names for the weapons, having an obvious connexion with the material out of which they were made, would give place to new names got from new materials, materials, too, not known to the Aryans. Since one of the first uses of metals would be to provide effective arms, it follows that the equipments of the Aryans must have been of a rudimentary kind—weapons of bone, of horn, or, it may be, of copper, and defensive armour of wood, or of hide.

With the reservation that copper may have been used in weapon-making, the nomenclature of weapons proves that the Aryans lived in a premetallic age.

There is no lack of written opinion on the mode of life followed by individual Aryan peoples. Casar ascribes nomatic habits to the Germans ('neque licter longius anno remanere uno in loco'), and there is documentary evidence to the effect that the Slavs frequently changed their abodes, while, even to the Greeks, Thucydides imputes in early times nomadic instincts—h γħ did vike ματαβολάς τῶν ολεατόρου είχτι.

If, at the dawn of history, this is the condition of the individual peoples, we are justified, making due allowance for the persistence of traditional habits, and the possible contemporaneous existence of features common to two modes of life, in concluding that the Aryans, when yet in the original home, were strongly infected with nomadic habits.

Not that the beginnings of agriculture were absent, there is evidence to the contrary, but, if salient characteristics determine definition, nomadic is the term that best expresses these.

Language, too, bears out the inferences to be drawn from recorded opinion and right reasoning. There is not among languages of the Aryan stock the general agreement in agricultural terms that exists in the case of purely cattle-terms, such as cow and sheep. On the other hand, there is strong agreement in the languages of the European members of the stock. Consequently, language forbids us to attribute agriculture, as an art, to the Aryans in the original home, but warrants us in asserting that the Europeans made common advances in said art.

Another consideration strengthens the ascription of nomadic habits to the original people. There can be no private property in land among nomadic peoples, and among peoples of historical times we find just what we should expect in legatees of nomadic customs. Among the Germans, Cesser says 'privati ac separati agri nihil est.' This state of things exists to this day in Russia, and can be predicated of several ancient peoples.

Note, too, that to assume common advances in agriculture on the part of the Europeans is not to assume a European period characterised by identity of language and manners, nor even to assume an acquaintance with metals. It is perfectly possible to have a contiguity that permits common advances in culture, and strong divergences in language, and it is not at all necessary to make acquaintance with metals the measure of acquaintance with agriculture. Many terms for agricultural implements or portions of them can be traced back to non-metallic materials, e.g., Goth. höha 'plough' is equated with St. höhha 'branch'. Numerous names prove that wood stiffened, if required, with stone answered every necessary purpose of agriculture. But there is no need to prove that agriculture may flourish with very primitive implements.

It will be well now to mention some of the resemblances that warrant us in speaking of joint advances in agriculture on the part of Europeans.

One of the few equations common to the Aryans in this connexion is Sk. ydvas 'barley,' Gk. ξud 'spelt,' &c., but we really do not know what is exactly meant by these terms, and very possibly they do not denote a cultivated product. There are one or two more terms arguing common knowledge on the part of the Aryans.

Compare this poverty with the wealth of equations to prove European community.—first in general terms—Gk. dypé₁ L. ager, A.S. acer, Gk. áréu, L. arő, Goth. arjan, Y. car, &c.; L. serő, Goth. salan, A.S. árvan, &c.; L. maíō, Goth. malan, E. meal, &c.; Gk. áren 'sickle,' L. sarpō 'prune,' &c.; L. porca 'ridge between two furrows,' A.S. furh, G. furche; Gk. áryō, 'chafī,' L. acus aceris, Goth. ahana, E. awa; next in products of the soil—L. grāmum, Goth. kaárn, A.S. corn, &c.; L. hordeum 'barley,' A.S. gersi, G. gersie, perhaps Gk. spibō (for xpvebō); L. fur, A.S. furn, &c. L. fuha, with Slavonic cognate; Gk. zephww 'onion,' A.S. hrause, E. ramsons, &c.; and Gk. μέπων 'poppy,' G. mohn, E. maroszed.

In addition to the agreement just exhibited between general terms, and the terms for such products as barley, flax, beans, onions, an agreement has also been established between the various terms for wheat, millet, peas. Such products, then, it would seem, were reared by the European section of the family.

These resemblances give sufficient ground for the assertion that agricultural terms are common only to the European branch of the Aryan family.

It should also be said that the Asiatic branch has some agricultural terms common to its members, but our means of information about these is very limited. After the dispersion, the European branch was forced by stress of circumstances to begin agriculture. In their wanderings, accepting Schrader's theory, they had passed out of the steppe country, favourable to nomad life, and got amongst forests that prevented them following the former free and easy life, and constrained them to take to tillage.

It is curious that an examination of Semitic and Egyptian culture, under this head, yields as a result almost the same plants as we have just mentioned. Nothing definite is known about the original habitat of these plants, or the way in which they may have been distributed by trading.

The nomadic life attributed to the Aryans is also shadowed forth in the correspondence of terms that have to do with waggon-building.

The European nomad had to make his own camel, the waggon was his ship of the desert. This is a fact that could be got at from written records. "Yagae domay, 'domus plaustris imposites' are expressions that argue a knowledge of this vehicular transit on the part of their framers."

To return to the correspondences, we have for wheel—Sk. ráthas 'waggon,' L. rota, G. rad, &c., and Sk. cakrás, Gk.

Manual of Linguistics.

xxxviii

zúzher, A.S. hweol, &c.; for axle—Sk. dkshas, Gk. äğen. L. axis, A.S. eax, G. acher, &c.; for yoke—Sk. yugdm, Gk. ζυγό, L. jugum, A.S. geoc, &c.

Nothing but a common use and wont in the art of waggon-building can account for these correspondences. The limitations that want of tools and other drawbacks would impose are also borne witness to in the terminology. There are no common terms for spoke and felloe, a fact proving that the wheels were made of one pick.

Even nomads, although they were not to remain longer than a year in one place, would be led to construct other shelters than their waggons. A life on wheels, in a bare country, during rigorous cold, would sharpen their inventureness. Tactius tells us that the Teutons had underground dwellings, and Xenophon in the Anabasis particularises some of the features of similar xerizyun since among the Armenians, viz. a vertical descent by ladder for human beings, and a side descent by sloping tunnel for cartle.

But language gives evidence of other and more ambitious shelters. House, or at anyrate, hut-building is proved by the following equations:—Sk. damás, Gk. čáµe, L. domur, Goth. timrja 'builder,' &c.; Sk. dvór, Gk. čápe L. foris, A.S. darn, &c.

Note also Gk. oriyor, L. tectum, Sk. sthag 'cover,' &c.

It is the materials used in building that prove hut to be the better term. Records and language alike prove these to be other than bricks and lime. To make use of the latter, G. wand 'wall' is equated with Goth. wandus' 'twig,' a connexion that at once suggests wickerwork. ἐροχή ' roof' and ἔροφος 'rush' suggest the same material. The equating of τέχρος (rt. dheigh) to fingö, figulus 'potter,' at once suggests clay.

Again, in Teutonic, most terms in stone building are foreign, taken from the Latin, e.g., G. mauer from murus, G. ziegel from tegula, &c.

We can not only tell the materials, but also guess the shape of the Aryan dwelling. The round urns in the cemetery of Alba Longa are known to be representations of the houses of the living; the houses of the Germans figured on the columns of Aurelius are round; and to regard this as a traditional shape of high antiquity is perhaps not to be unduly rash.

The Aryan dwelling-would seem then to have been a circular structure, made of such materials as wood, clay, and platted twigs, and perhaps sunk into the earth for protection. A further proof of its rudimentary nature is got from the fact that windows seem to have been a later addition, the words for window not exhibiting correspondence.

Possibly the headmen of the tribe occupied more pretentious buildings constructed on similar lines.

To nomads who lived by cattle-rearing the materials for clothing were at hand. Hides would naturally be resorted to. That the Aryans had reached that point in civilization in which the investiture of the person with a covering has become a detail of living is rendered probable by these cognates, viz., Sk. vas 'clothe,' Gk. liviju, L. vestili, A.S. zeyrian, Goth. vazjan.

That the first clothing was hides, language bears evi-

dence, e.g., $\beta \omega i \tau_1$ 'a coat of skins' corresponds to Gothfatida (E., $\rho \alpha j a i c k t^2$); $\sigma \epsilon u w'$ 'dress' and $\sigma \kappa \bar{\nu} \tau \varphi e'$ skin' have the same root; $\sigma \omega i \varphi a$ 'a rough outer garment' (orig. of pigskin) and $\omega \bar{\nu}_e$ are probably connected.

But the Aryans were more deeply versed in the philosophy of clothes than to mark time at skins.

There are proofs that they knew how to manipulate their material. The art of making felt seems to have been known to the European section. For this compare Gk. e70s, L. pileus, Ger. file.

A general term for plaiting is well distributed, e.g., Sk. prainas basket, Gk. 2012a, L. pleciō, G. flechten, &c.

There are terms, too, for weaving and spinning, though the terms for the latter have not freed themselves from the meaning of plait.

For wearing take St. va, Gt. topans, A.S. wofan, G., toden. Here, too, consider the following correspondences, establishing the existence of the art, and the position occupied at its practice, furnished by the root shi 'stand,' viz., St. sthdois weaver, Gt. levie 'born,' and ordens' warp,' L. sthams' warp,' Coth. stime 'stuff.'

For spinning we have Gl. sin, L. neö, Goth. nehlad 'needle, G. nähen. It seems we cannot compare here any words that argue original sn, such as Goth. snörjö 'basket,' for that combination, had it been true for the above, would have survived in Gothic.

That wool was a material known to the original people is obvious enough from this equation, viz., Sk. """ I. länu, Gk. oblos (Folios), L. vellus, Goth. walla, &c.

It is also very possible that flax was used in these arts. We saw above that a term runs through all Indo-European languages, and Homer speaks of the Parcae spinning flax.

To sum up what can be made out anent the clothing of the Aryans, it seems probable that originally a stretch of flaxen or woollen material was thrown over the left shoulder, as the primitive skin was, that it was then brought round the back and front and fastened to the left shoulder by the fibula, somewhat after the fashion of the Roman toga.

A tunic—Gk. χιτώι, L. tunica (ctunica), both from the Semitic—was not originally worn.

Sewing of some sort (Sk. syū-, Gk. zassúu, L. suō, Goth. siūjan, &c.) was practised.

The Aryans, as was natural in the possessors of flocks and herds, were flesh-catters, and further, possessed some knowledge of cookery. A term for raw, red meat runs pretty well through, viz., Sk. krents 'raw meat,' Gk. κρίας, A.S. kriens' 'raw,' &c. A knowledge of cookery is argued by Sk. μα' cook;' Gk. views, L. copul, &c.

The original meaning of these is simply 'coast.' Not that flesh was always roasted, for doubtless the Aryans, as some still do, often cooked their food by eating it. Wild fruits were also eaten, and of course cereals, when their culture was introduced, formed a staple article of diet.

Doubtless the Aryans drank milk, although the Sk. duh. 'milk' is different from Gk. duh.yo, L. mulgo, &c., and a common term for milk is only to be found among peoples whose territories presumably marched on one another, viz., Greeks and Latins (waka. del.) Teutons and Celts (Goth. miluks, Ir. melg). One equation, however, argues community under the head milk, viz., Sk. såras 'cream,' Gk. 560; 'whey,' L. serum 'whey.'

It would be too much however to argue that the original people could make butter and cheese. These demand processes that do not seem to suit the habits of nomads or ex-nomads.

Mead is the intoxicant for which we have an Indo-European equation—Sk. mddhu 'sweetness, honey, mead,' Gk. μίθυ 'wine,' A.S. medu, G. meth, &c.

These names prove that honey must have been an ingredient, probably, Schrader thinks, procured by trading, for the country to be selected as the most probable home, of the Aryans is not wooded, and common terms for bee and wax, together with a definite term for honey, are only Editopean.

Schrader seems rather to underestimate the importance of the general diffusion of words for mead. His choice of the steppe region for the original home has led him to do this.

Wine was of course not known to the Aryans. The Teutonic, Slavonic, and Celtic terms are borrowed from winum. Finum and she are, however, mutually independent formations, probably from the root wi 'to twine,' and date from a time when the Italians and Greeks lived in the north of the Balkan peninsula.

It is a curious and suggestive fact that most of the peoples who have sojourned in or near this part of Europe, have similar terms for wine, among the rest the Albanians and the Armenians. Mention has already been made of the tradition that identified the Armenians with the Phrygians, who are called actures var Ofazar. Further, xal.16, a term for unmixed wine, is correlated by Schrader with an inferred Sabine fall seen in ager Falernus.

It is quite probable that the Aryans had made a beginning in trade. Trading is developed bartering, and for this practice the Indo-European vocabulary argues volume and precision enough to entitle it to the name trade. Certain terms, varying, as is natural in terms for bartering, between the meanings of buying and selling, have vide distribution, viz., Sk. vasndm 'sprice,' Ck. hose 'price,' L. vizum' 'sale,' &c.

There is a common root for measure, viz., Sk. mā 'measure,' Gk. μέτρον (μεβτρον), I. modius 'corn-measure,' Goth. mitan, A.S. metan.

If we add to this that standards for measurement are found in the body at rest or in motion, e.g., foot, cubit, pace, &c., we see that all the conditions for trading are present.

There are considerations which seem to show that this was not always confined to tribal areas, even in the joint period. No doubt strangers were at first looked on as enemies; the fact that the words for stranger and enemy coincide proves this. Goth, gasts is cognate with hastir, and £in-(fres (ghsenyos, the -nFe- is a nominal suffix) has with Brugmann's approval been correlated with these.

But these words at a very early period took on a softer meaning, and among the Indians, Greeks, and Italians, precepts counselling hospitality are of very old date. The suggestion that this altered attitude towards strangers was brought about by trading relations, that strangers passed from providers of goods into profigir of the gods, that abstention from hostile acts was in the beginning simply on each side an arrangement for mutual benefit, finds some support in a ceremony of guest-friendship, viz., the exchange of tokens (eighthar), festerate), a survival of the exchange of wares.

It would then follow that trade between strangers was older than hospitality, old enough perhaps to be predicated of the Aryans in the joint period.

Inasmuch as the Aryans were unacquainted with the sea —a common term first occurs among the Europeans, viz, L. mare, Ir. muir, Goth. marei, E. mere—sea-going trade did not exist.

The series of words—Gk. āh.c, L. sāl, Goth. sali—originally meant salt, and even if they originally meant sea, we are still in Europe, for Sk. sdras 'lake, pool' can hardly prove anything about sea.

The trade that flourished was overland or along the banks of rivers. There is nothing common in the way of nautical terminology to invalidate this, it is only terms for rowing and boat that are common, e.g., Sk. aritras 'rudder,' Gk. iprenis' our,' L. rönus, A.S. röber, &c., and Sk. nöist, Gk. swir, G. naus.

It is assumed that the latter word denoted the hollowedout trunk of a tree. But could such trunks be readily got, if the original home is placed with Schrader in the woodless steppe country.

In the European languages, mast (L. mālus, A.S. mest, rt. muzās) has a common term, but even in these, there are great differences in the nomenclature of the other parts of a ship. A fair idea of the material culture of the Aryans may be got man examination of the culture disclosed to us in the disinterred lake-dwellings of Switzerland. The facts brought to light in connexion with these seem to prove that the lakedwellers were just at that stage of culture that one would be led to predicate of the Aryans.

To complete an account of Indo-European culture it still remains to put down something about social progress and intellectual conceptions.

Under this head let us note first the names of kin that are common to the Aryans. Their extension, although I do not put down all the languages in which they occur, will, I deiessay, be fairly apparent. They are these:—father, mother, son, danghier, brather, sitter, father's brother, father-is-law, mother-is-law, daughter-is-law, husband's brother, husband's brother vaives, grandom (nephew) (Sk. pithr., māthr, mush, dahitdr, bhrdhar, xodair, pitrypus, fodiuras, touriris, mush, dahitdr, bhrdhar, xodair, pitrypus, fodiuras, touriris, mush, dadwr, ydiarras, ndpāri- (K. warip, hurn, wish, byrden, pitry, — adreps, impé, impé, vie, oatp, survey, impé, impé, vie, oatp, imries, law, interest, daw, interest, daw, interest, and hor, prison, musus, löwir, jauliries, nepā; A. S. Jeder, mādor, xium, dahtor, brison, woestor, fathera (G. vetter orig, 'uncle'), svoor (G. schwider), svoger (G. schwiger), moru (G. schwir), fator (O.H.G. schhur), mafe).

There are double sets of words for father and mother running through the Indo-European languages, the above, and a set of initiative formations, e.g., Goth. atta 'father' (di'pei 'mother'), cp. Gk. årre, L. atta, Sk. attä 'mother.' It will be noticed that the Indo-European terms for son and daughter are missing in Latin, and are supplied

by filius filia, connected either with fellö 'suck,' or çῦλω: 'tribe.'

In Greek, \$\(\rho \text{far}\) has of course another meaning than brother, and there also the word for sister is distinctive, but the word fore; 'cousins,' quoted in Hesychius' Lexicon, seems plausibly cognated by Schrader with the other Indo-European terms. He suggests that the word originally meant 'sisters,' then 'sisters' children,' then 'children of brothers and sisters,' comparing the Latin consobrint,' which originally meant 'a pair of sisters.'

The word for father's brother, as seen above, is very well distributed, the word for mother's brother is not an Indo-European one. A term for this relative is seen in L. anumatus, A.S. čam (cp. Eames, proper name), G. ohcim. Avunculus 'little grandfather' is, I suppose, a hypocoristic term from avus.

Perhaps it is worth noticing that it is in European that the ... nepôs-row has taken on the meaning of nephew.

There is no Indo-European term for grandfather or grandmother.

It seems well to notice here a fresh proof of the affinity

between Teutonic and Slavonic, exhibited by the presence in them of a common term for grandson, seen in G. enkel (dimin. of ahn). There is no Indo-European term for sonialaw. Correspondences however are met with in various languages, e.g., in Teutonic——A.S. āðum, G. eidam.

A glance at the terms for affines in the above list, proves that it is only the husband's side of the house for which a terminology has been provided. There is not an Indo-European term to denote a relative who has become such in virtue of relationship to a wife. For son-in-law, there is no common term to suggest that the wife's parents claimed kindred with their daughter's husband. The wife seems to have merged her individuality and her family in those of her husband. This leads to a conclusion quite opposed to the theory that the woman was the stable factor in calculation about parentage. If circumstances once made relationship in the female line the surest way of allocating a place to a child in a clan, language seems to prove that these circumstances either never existed in the case of the Aryan, or had passed away before language was developed enough to record them. Westermarck in a recent work explains primitive life in general on the patriarchal theory.

The Aryan family, then, was one in which relationship through male connexion was the title to membership. In the Aryan family—can we use the term family if this does not exist—there was paternal supervision and authority. Sonship was a reality, very much the reality that it was in early Roman times.

It is true also that the common terms for relatives on the wife's side, possessed by certain groups of languages, argues a very early acknowledgment of such relationships.

Wives were procured, in the very early days of Aryan life, when the various wandering households observed a semi-hostile attitude to each other, by capture. The existence among the Aryans of this generally prevalent practice is also indicated by the absence of terms implying the recognition of affinity on the wife's side. Afterwards when milder manners obtained, purchase was substituted.

There can be little doubt that the right of the husband— Sk. pátis, Gk. asas, L. potis 'able,' Goth. (bruh)/abs 'bridegroom'—over his spouse as wife or as widow was that of the owner of a chattel over its disposition. Suttee is an Aryan survival.

As a political unit family meant an aggregate of several households controlled by a paterfamilias. In the progress to political development, the next complex to family is that of brotherhood. This meant an association of families having a common ancestor, each of which had hived off in succession from an overgrown family, to find virgio pastures and procure more space. The term for this brotherhood in Greek is persita, in Latin, gens. To this day the bratuse of Herzegovina supplies an example of what we may suppose the Arvan brotherhood to how been.

Before the disruption, the constituents of the Aryan race, each a potential nation, may be supposed to have developed tribal organisation and to have possessed tribal solidarity. That they had arrived at such a concept as a name for the united race is unlikely.

Did the Aryans have a conception of the divine, and if they did, what were their divinities? To answer correctly the first question, one ought to discriminate carefully terms, the religious import of which is an after growth of separate national life, and terms that may be supposed to have carried down their religious import from primeval, times. There are really no words that we can confidently place in the latter class.

In the primeval period the consciousness of the divine must have been rudimentary, and many roots would afterwards by the workings of anthropomorphism acquire a religious meaning. Of these roots, when the need for a religious vocabulary arose, some areas would use one others. another. This consideration may account for the dearth of common terms expressing the divine. If, however, the objects that are known to have been subsequently worshipped by individual peoples have common names, it is just possible that these latter in the primeval period excited the reverence of the joint people. Such common names there are :—dawn (Sk. 11184, Gk. 162; (see page 115), L. 21187, S. 21187, S. 21187, S. 21187, L. 21187, S. 21187, Ch. 21187, L. 11878, L. 11878, S. 21187, S. 21187, S. 21187, L. 21187, S. 21187, S. 21187, L. 21187, S. 2118

That these objects were defined in one quarter or another is matter of common knowledge.

The only way to arrive at an opinion about Aryan notions of the afterworld is to examine the beliefs of separate peoples and more or less plausibly project them into the primeval period. In this connexion it is important to note that ancestor-worship, an injunction of Indian religion, and a national trait of the Romans, has no existence among the Greeks of the Homeric are.

The Aryan mode of computing time has to be attended to in an account of Aryan culture. Should we be able to learn the number of seasons in the year of the primeval people, and discover details regarding the characteristics of these seasons, we shall, with the knowledge of climate so got, be much better able to select a suitable spot for the original home.

Manual of Linguistics.

Beginning with terms for seasons, we find that common names for winter and allied notions are very widely distributed, e.g., Sk. hēmantás 'winter,' himás 'cold, winter,' Gk. χιμώς, χιώς, χίμαιρα 'goat' ('yearling'), L. hicms, Sc. rimner (Cn. E. wether, Gk. Fee, L. wether, Sk.

There is also a series of allied terms for snow:—Gk. είφα, L. nix, A.S. snāw, &c., including a Zend cognate.

There are three groups of words for the portion of the year that is set over against the wintry portion, viz, Sk. sutantif, Gk. Isa, L. wêr, Sec.; Zend yêre 'year,' Gk.' wea, Goth. jêr'; Sk. sûmā 'half-year, year,' A.S. sumor, &c. I ought to mention here that there are difficulties in connects in a sum of the word in how we will be sufficiently the property of the second of waning than of growing light (cp. vesper, &c.)), e.g., Gk. see ought to become s. The best account of the Clastical Review, vol. v., p. 10. He derives both from a root of 'blow,' making ine = FaFagigr), and vêr = verer. Of course this disconnects with Sanskrit.

These terms do not represent divisions of the non-vintry part of the year, but are different names for the same thing. Their meaning fluctuates in different reas, and even in the same area there is evidence of instability. Perhaps **rdmd* originally 'half-year' was a sort of unattached synonym for the non-vintry portion of the year. The **vannths* series seems to have properly denoted the commitmenent of the hot season, for they are not used as names for the whole year like the others.

To say nothing of the twin powers of the year storied in mythology, there is a dualism present in the nomenclature, e.g., summer and winter, vasantás and hēmantás, with similar suffixes, that impels us to assume an original division into two, and only two parts.

After progress had been made in the cultivation of coreals, it is likely that some designation would be set apart for harvest-time, and probably a term common to the European group arose at this stage, viz, L. annus (annos), cp. annöna. Goth. asons 'harvest' (E. earn').

When the peoples had separated and reached other localities, names for different periods of the warm part of the year were coined, and existing terms were attached to definite periods.

The existence of correlates like Sk. vatsås 'calt', L. vetus '.full of years,' vitulus 'calt' ('yearling'), A.S. vvõer 'wether,' seems to prove that the Aryans were able to conceive of the year as a whole.

There was also a roundabout way of expressing the idea of year by means of an enumeration of its various parts, and in many of the Indo-European languages a fashion grew up of substituting a part for the-whole, e.g., winter for year.

A word for month has wide distribution—Sk. mås, Gk. μέν, L. mēnsis, Goth. mēnēþs, &c.

There was also a word for moon belonging to the series, seen in Goth. mēna, but in many quarters it was replaced by words from fitting roots.

When the moon had furnished a unit of measurement, observation would teach that some twelve of these units or months elapsed between the first appearance of the cold season and its re-appearance, and so long as there only existed a rough division of the year into a hot season and a cold season, the discrepancy between the lunar year and the natural year would not obtrude itself.

A word for night runs right through the Indo-European languages:—Sk. naktis, Gk. wig, L. nox, Goth. nahts.

A comparison of the words for summer and day does not reveal the community that a comparison of the words for winter and night does.

That the Aryans measured the month by nights, just as they measured the year by lunar months, is evidenced by facts in language and by the reports of observers. Language proves that winter bulked very largely in the lives of the Aryans, and so must night, winter's ally and exponent. To this day in English we use the terms fortnight and sennight.

In words for evening differences appear. A term for evening seen in Gk. israfea, L. resper, &c., has some distribution. The term seen in A.S. ofen, G. abend is confined to Teutonic and is quite obscure.

Before presenting any conclusion regarding the originalhome of the Aryans it will be proper and helpful to devote a page or two to record some of the results that have been arrived at ament the animals, the birds, and the trees of the trimeral epoch.

The animals domesticated by the Aryans were the cow (Sk. gräß, Ck. Sove, L. Sov, A. crī, &c.), the sheep (Sk. dvig, (Sk. srg, L. ovir, A.S. čonu, &c.), the dog (Sk. sodar, Gk. xóun, L. canir, A.S. hund, &c.). A word for goat, seen in

Sk. afds, Gk. aff., &c., has a measure of extension.

There is even a common collective name for cattle (Sk. páius, from root paí, 'fasten, tether,' L. peas, Goth. fathu, G. vich.

The pig was probably not domesticated when the peoples-

were still united. It must, however, have been known, for there is a common name (Sk. 5ii-kard-, Gk. 16, L. 1815, A.S. 181, &c.), Pig-rearing is not mentioned in early Indian literature, and implies a more settled life than can be predicated of the original people.

The horse, probably in a half-wild state, was known, as is evidenced by the inames (Sk. divas, Gk. foras, L. equus, A.S. eak, &c.), but presumably was not used as a beast of burden. Words for riding differ in the various languages. From this one feels disposed to conclude that riding on horseback was not an established practice.

The ass, the mule, and the camel were not known during the joint period. The mule is thought to have been first bred in Pontus, the ass_and the camel, certainly domesticated at a very early period by the Asiatic branch, came originally from Eastern deserts and stepped.

The absence of common names for ass and camel does not suggest an Asiatic site for the original home.

Gk. *ses and L. asinus are-independent borrowings. G.
Meyer (Brugmann's 'Indogermanische Forschungen,' vol. i.,
p. 319) says that the animal and the name were probably
got from Asia Minor through Thracian-Illyrian intervention.

To the same region he traces back mülus (muslo, lo dimin. suffix), and making capital out of a remark of Anacreon's to the effect that the Mysians first bred mules, dubs the word an appellative ('the Mysian beast') turned proper name.

Other animals named by the Aryans are these:—wolf (Sk. orkaz, Gk. hönes, L. lupins, Goth. voulfs, &c.); bear (Sk. frinas, Gk. åpres, L. ursus, &c.); otter (Sk. urfrid, Gk. 28pes, G. otter, &c.); mouse (Sk. min, Gk. µū, L. mūs,

A.S. mūs, &c.); hare (Sk. śałás, A.S. hara, G. hase, &c.); beaver (Sk. babhrús, 'brown,' L. fiber, A.S. beofor, G. biber); polecat (Sk. kašikā, and Lithuanian cognate).

The jackal belongs to the Asiatics.

To the Europeans belong the hedgehog (Gk.-ig/he, A.S. I./ G. igul, &c.); the lynx (Gk. höyk G. hints, &c.); the weasel (Gk. alihayes (df-mh.), A.S. menle, G. wiezel); the hart (1. Gk. hints, with Celtic, Slavonic, Lithuanian, and Armenian cognates, and a. Gk. nyasis, 'horned,' I. cervus, A.S. horost, G. hirtak (t als Ableitung bei Tiernamen im Germ.) Kluge); and the boar (L. ajor, A.S. sofor, G. cher), &c.

The tiger, the lion, the elephant, and the ape have not common names and were not known to the united people. It is well, however, to remember that certain animals may not have had names specialised for them, and may have been merged in the general term 'wild beasts'

The name for tiger is of Iranian origin; as to the names for lion, usually considered borrowings from the Greek, it is just possible that they may be to some extent independent formations. At any rate, it is difficult, on the hypothesis of borrowing, to account for the various forms of the name, and the animal was not unknown in Europe, for we read of lions in Thrace.

In putting down common names for birds, one cannot

but suspect independent, imitative origin. To this suspion or expose the following:—ow! (Sk. dilikat, L. ulcia, G. ulci) suckoo (Sk. kibilat, Gk. xuxug, L. uculkut, &c.); hen (Sk. kṛkanākus, Gk. xipse, &c.); jay (Sk. kikidīrst, Gk. xiesa G. hāller); moorfow! (Sk. tittiris, Gk. rerpius, L. tetrao, &c.

Outside these words of imitative origin there are few common names. Such are quail (Sk. vartakas, Gk. éprely): goose (Sk. hańszás, Gk. Xip, L. (h)ânszr, A.S. göz, gandra, G. gan); duck (Sk. ätls, Gk. rivers, L. anās, A.S., aned, C. ente).

Schrader also quotes as cognates Sk. Syends 'eagle, falcon, hawk,' and Gk. inches 'kite.'

To the European languages belong these:—eagle (Sk. *urs, A.S. earn, Goth. ara, G. aar, &c.); crane (Gk. yirsms, L. gräx, A.S. eran, &c.); wagsail (Gk. xir\text{hom}, with Lithuanian cognate); throstle (L. turdāle, A.S. \text{brostle}, G. droste\text{hom}, &c.); stating (L. turdāle, A.S. \text{brostle}, G. droste\text{hom}, &c.); ara); wodpecker (L. picus, G. pech). If the last names can be brought into line with Sk. pikas' cuckoo,' they may be added to the group of common names.

There are one or two European names of obviously imitative origin. These are crow (Gk. κόραξ, κορώπ, L. L. συνικ, αντική,); hoopoe (Gk. του), L. μομρα): owl (Gk. βύας, L. διδιδ, but there is an Armenian cognate).

There were no tame birds in the primeval period. The duck, the hen, and the goose were all wild.

The only common word relating to fish in Indo-European is the word for eel (Gk. \$750.00; L. anguilla, &c.). Even these are supposed to have been coined by each people separately from the word for snake, seen in L. anguis (A.S.

Jee, G. unke). Now L. anguis and anguilla were popularly connected with each other, but the meaning 'cel' is constant in Tyzen.vs. Can this last be connected with Sk. dhis, Gk. Tyze?

There are not many tree-names common to the European and Asiatic branches. Such are birch (Sk. bhhr/as, L. frāxinus, A.S. beore, G. birke, &c.); willow (Gk. bria, L. viiex, A.S. willow, G. weide, &c., with a Zend cognate).

The names that in various areas denote tree, pine, oak, are theire.—Sk. dris 'tree,' ddn' 'wood,' Ck. δρis 'oak,' L. Maced. δάρυλως 'oak,' L. daris (daris) 'larch,' Goth. tris 'tree,' (S. cirbe) 'stone-pine.' The original meaning, Schrader thinks, was tree (see late ro.)

There is store of common tree-names in European:oak, &c. (1. Gk. alythery 'species of oak,' alystees 'poplar,' alyavin 'spear,' L. aesculus (aersculus), A.S. ac. G. ciche, and 2. L. quercus, A.S. furh 'fir,' G. föhre); beech (Gk. cny6c 'oak,' L. fagus, A.S. boc, G. buche); pine (1. Gk. creukf., G. fichte (O.H.G. finhta), &c., and 2. Gk. wirus, I., pinus for pitnus (taken along with Sk. pitu-därus these names have a claim to be common)); sallow (Gk ilin, L. salin, A.S. eall, G. sahl(weide), &c. ; hazel (L. corvlus, A.S. hasel, G. hasel, &c.); elm (L. ulmus, A.S. elm, &c., perhaps Sk. dragyam 'wood' (from armnya-)); alder (L. alnus (alsnus). A.S. alr, G. erle, &c., perhaps Sk. rshfis 'spear'); maple (Gk, anaoros, L. acer, G. ahorn); ash (A.S. asc. G. esche. &c.); aspen (A.S. asp, G. aspe, &c.); yew (A.S. iw (cow), G. eibe (O.H.G. zwa), &c., from this comes Fr. if, through Mid. Lat. Fous).

The Greek correlate for beech has assumed the meaning

'oak,' and in Slavonic there is no native term for beech. The Greeks must have passed from a country with beeches to one without. This tree, in fact, does not grow south of a line drawn from the Ambracian to the Malian Gulf. The original home of the Slavs was outside of the eastern boundary of the beech-zone, viz., a line drawn from Köniersberg to the Crimea.

From the limited number of agreements in tree-names one is entitled, according to Schrader, to conclude that the country of the primeval people was not well-wooded (but the pine, the clim and the alder may perhaps be added, cf. tree-names above, and see later on).

It is possible, however, to push a negative conclusion too far. It may be that the Asiatic branch on leaving an original home that was well-wooded, sofourned for a considerable period in a region that was comparatively trecless, and there lost the names they once possessed. On again settling in a forested district the names of the new coinage would not correspond to those that had first issued from the mint of the pudivided people.

Common names for birds are not so numerous as to justify us in asserting woods to have been a prominent feature in the landscape of the original home.

If a consideration of other facts leads to the assignment of a somewhat bare district as the original home, the paucity of trees argued by the above comparisons will not be without corroborative force.

There are no common names for mountain and valley.

For water and its manifestations we have Sk. uddn., Gk.

Fow L. unda, A.S. water, Goth. wate, &c.; Sk. plu, pru

float, flow, Gk. er.sa, L. phiti, A.S. flotan, &c. To Euro-

pean belong L. aqua, Goth. ahwa, A.S. ēa (ahwu), G. aue 'Wasserland.'

It falls now to utilise all that has been learnt regarding Aryan culture to assist in determining the scene of the joint life.

This used to be laid in Asia. The primitiveness of Sanskrit, the ancient civilisation and traditional antiqueness of the East, the reputation of Asia as the offician gentium, all tended to the allocation of an Asiatic site as the scene of the joint life.

Primitiveness of language proves nothing as to primitive home, and the presence of archaic traits in "a language manifestly does not prove its speakers autochthonous in the district or zone. These traits, too, must be gleaned from documents of the same date, and must be appraised as well as counted. Civilisation is not so old as life or language, and depends so much on external and. fortuitous conditions, that priority in civilisation does not argue a prior occupation of the country that is its sent).

The possibility of another than an Aniatic scene in due course suggested itself. Latham, arguing plausibly that the whole must originally have been located where the majority of its parts are, maintained the possibility of a European home. Benfey, arguing from the absence of common ammes of beasts of prey, supported a European site, and located the original home north of the Black Sea, between the Danube and the Caspian. Geiger, to keep to the habitat of the bear, and Cuno, to secure a homogeneous area, put forward Germany as the most probable site. Pösche, to account for the blondeness which he assumes to be a distinguishing characteristic of pure and original

Aryans, located the original home in West Russia, in the swampy district of the Pripet, a tributary of the Dnieper. where albinoes are rife. Lindenschmit, partly for common reasons, and partly owing to a disbelief that a race of Asiatic origin would have exhibited the energy and expansiveness of the Arvans, pronounced against Asia. Penka. building on cranioscopy, has supplemented Pösche's description of the pure Aryan, and making him out to be a dolichocephalic blonde, has found his most natural home in Scandinavia, a conclusion supported by the fact that the common culture revealed by an examination of the Indo-European language, is the same, according to Penka, as that revealed by an examination of the prehistoric remains found in Scandinavia. Tomaschek locates the original home . somewhere near the Finnic-Ugrian domain; Taylor, in arguing for an affinity between Finnic and Indo-European. is committed to a site that will explain this; Piètrement imagined he had made out a case for Siberia.

Only a year or two ago, J. Schmidt, influenced by traces of a duodecimal mode of reckoning discernible in Indo-European (chiefly seen in Teutonic, compare the breaks in formation after 12, 60, and 120; compare also the use of L. sestent is a big round number with some sort of finality about it, also the break in the formation of Greek cardinals after 60), deemed it necessary to assume for the original home a site that was in touch with Babylonia, where the numeral system had 60 for a progressive basis. Thus would have been given the first definite proof of an Asiatic home. To begin with, such a mode is not to be detected in Indo-Iranian, and traces of a duodecimal reckoning are so wide-spread (found in China, and in Siberia; compare also the

part played by the number 1z in matters Etruscan), that it seems difficult to localise one centre of diffusion. Besides, a prominence given to the number 1z-(what of the 1z mon months, and the 1z added days) might account for excrescences in the decimal system $(60-5\times1z, 120-10\times1z)$. See Hirt's article, 'Die Urheimat der Indogermanen,' in Brugmann's Journal, vol. i. page 464.

Schrader's theory of the original home is plausible, wellreasoned out, and merits attention. It is proposed to give a brief account of it.

Schnder prefaces his attempt to assign a site for the joint life of the Aryans by a determination of the spot where the Europeans and the Indo-Imanian respectively passed through periods of common culture. The scene of the common European culture he makes out to be the tract of country bounded on the south by the Danube and the Black Sea, on the east by the Dnieper, on the west by the Carpathians, and on the north by the swamps and deuse forestry of Volhynia. The scene of Indo-Imanian culture is made out to be that portion of Eastern Iran that comprises the ancient provinces of Sogdiana and Bactrians.

The first-mentioned site suits the facts that the dark for a common European culture supply. The trees for which common names exist in European all grow here. In this area might very well take place that change from a nomadic to an agricultural life that the European common language reflects. The obstructions on the borders would give pause to nomadic habits, the closer packing in space, due to the repression of these habits, would force attempts to add to the spontaneous gifts of the earth, the fertility of the soil would richly reward and increase all such attempts. All

the animals peculiar to the European fauna are to be found here. Here too the sea, not known in the primitive life, would first be seen, and a term coined. And from this area we can most easily account for the passage of the Europeans into their historical homes. The Slavs and Lithuanians would follow the course of the Dnieper to their home north of the Pripet, outside the zone of the beech; the Teutons would follow the course of the Dniester to their probable centre of diffusion, the basin of the Vistula and Oder; the Italians and Celts together would follow the course of the Danube, the former passing into Italy by the Gulf of Venice, the latter going further up the Danube, and thence passing to their original seat, the central basin of the Rhine.

The choice of Eastern Iran as the scene of the Indo-Iranian period of committon culture, has much to recommend it. The region, not without facilities for a nomadic life, would induce and favour a transition to an agricultural life. Here also can be got the gold that was known to the Indo-Iranians. This region, too, is a long way from the sea, quite an indispensable condition for the scene of the joint Indo-Iranian life, inasmuch as the words for sea in Iranian and Sanskrit differ. The similarity that exists between river names in Sanskrit and Iranian is accounted for by the part that rivers play in this district.

After thus allotting to the Europeans and the Indo-Iranians areas for their respective joint lives, Schrader sets about providing an area that will be suitable for the Aryan joint life before the dispersion. Roughly bisecting the distance between the alleged European and Indo-Iranian areas, he selects for examination the tract of country that lies in the basin of the Middle Volga, north of the sandy steppes of the Caspian. Incidentally, he notes that this site will explain many of the points of contact between the Finns and Avanas that language reveals.

'Pā, too, the Greek name of the Volga, is made to yield evidence that favours this site. It may be supposed that the Finnish name Rawa or Rau, from which the Greeks got their 'Pā ('PaFa), derives from an I.E. sravā, adopted by the Finns, who entered this district after the departure of the Aryans. Rha has also been connected with Zend Ravha, the name of a mythical river, and seeing that

Iranian tribes did once dwell in the neighbourhood of the Volga, this etymology is not to be lightly set aside.

The climate of this area suits the facts that an examina-

tion of language disclosed. The winter is long and severe.
The hot season follows hard on the cold, and so little gradation is-manifest in the passage from extreme cold to extreme
heat, that there are practically only two seasons in the year.

tion is manifest in the passage from extreme cold to extreme heat, that there are practically only two seasons in the year. This is just the state of things that the common language reflects. The landscape is comparatively treeless, but on

the banks of the rivers are found birches and willows, both primitive trees, as we saw above. The animals that figure in Indo-European equations are found in the steppe, viz., the wolf, the otter, the mouse, the hare and the polecat. The bear is not a native of the steppe. We must therefore

The bear is not a native of the steppe. We must therefore suppose that his incursions into the alleged primitive area were frequent enough to procure him a name. The fox is found all over the steppe, though we saw that the name was in extension only European. Perhaps the Asiatic branch lost the name. All the primitive domestic animals are natives of the steppe—the cow, the sheep, the dog, the

goat. The life here is still largely pastoral. Wealth is measured by flocks and herds. The ox is still the beast of burden, and horses are reared in half-wild herds. Of birds, the eagle, the falcon, the owl, the wild duck, the goose, the len, &c., are found in the steppe. The streams are stocked with fish, so that the lack of a common name relating to fish must be owing to the fact that the primitive people were not educated up to the point of fish-catching. The love of sport in general is of late growth. Salt is plentiful in the steppe, and must have been known. The term must have dropped from the vocabulary of the Asiatic branch. The forms too for salt have features that only primitive words have. The dwellings are underground and altogether seem a reproduction of the Armenian xarayus sinus described by Xenophon.

The manufacture of felt, a primitive industry, is still engaged in all over the steppes.

A good case is thus made out for the site tentatively chosen as the scene of the joint-life. The inductions that an examination of the language caused to be drawn are fairly well borne out by the objective realities of the steppe country of the Middle Volga.

It seems to me that Hirt ('Die Urheimat der Indogemanen,' Brugmann's Journal, vol. i., p. 464) has picked some holes in this theory. He gives plausible reasons for adding the pine and the oak to the list of Indo-European treemanes. To the word appearing in Greek as \$\phi_0^*(\text{ oak}'\) he assigns 'pine' as the original, and 'tree' as the engrafted meaning, quoting in support Sk. divo-dirers and fellu-dirers, both denoting species of pines, and rejecting the Greek

meaning, as discounted by the shiftiness of that language in the matter of tree-names.

Another pine row is got from Sk. pitu-dārus, Gk. airus, L. pīnus (from pītnus or pītsnus).

For quereus, G. föhre 'fir,' orig, 'oak'—qu may be orig, p, cp. quinque and civit—he pushes forward additional cognates, viz, Goth, fairpanit ('Gebirge,' unspringible' Eichenwald, dann 'Wald,' 'Wald-gebirge'), Sk. Párjanyas and Lith. Perhunes both thunder-gods, but now known by what was originally a byname-oak-god.

If this presentation of cognates is correct, the site chosen for the original home must be one where the four Indo-European trees (the birch, the willow, the pine, and the oak) grow together. Such a condition throws out of count not only Asia, but Schrader's steppe country. The site must be European and wooded, and Hiir-pitches on the country on the Baltic just outside the N.E. corner of the beech zone. He chooses a maritime region, believing that the sea was known to the undivided peoples. The Eastern peoples lost the cognate of L. mars, &c. In the words of which way, is the Greek representative it is more correct to, recognise something that was sea-going, besides, mars must be an old soldier, neuter stems in i belonging to an ancient and extinct formation.

Perhaps agriculture was known to the Aryans, for the absence of common terms in East and West may be due to the loss of a culture-gain on the part of the East, brought about by a wandering over steppe country.

The site chosen is favourable to bee-life, and has still wolves and bears.

It is thus also possible to explain the archaic character of

1xv

the languages in the neighbourhood, viz., Lithuanian and Slavonic. They have been least subject to dislocation and foreign influence.

How long the Aryans retained their purity of blood and racial solidarity, what effect race-mixture had in accelerating the disintegration, and in accentuating the differences of the cognate dialects, at what stage in speech-development, and to what extent, foreign factors began to colour the various results are questions that naturally suggest themselves, but do not admit of ready answer.

It is at any rate true that for differentiation in language and ultimate disseverance a mixture of races is not needed.

What the Aryans were physically, there are not sufficient data to pronounce. Some call the pure Aryan blonde and dollchocephalic, but the fact remains that very many of the so-called Aryans are dark and brachycephalic. Which of these represent the Aryan, and which the Aryanised races, is not positively certain. There cannot have been developed two distinct types of pure Aryans, for type is very permanent, and it does not seem permissible to suppose that two racial types, before the appearance of language proper, were thrown together to evolve in social union but racial isolation, the garent sneech of the Aryan tribes.

A page or two on the opinions now generally prevalent regarding the origin of speech will fitly close the introduction.

Speech arose at various points on the earth's surface. It was polyphyletic in origin and not monophyletic. The be-

ginnings of speech must have been the same all the world over. Man has the same speech-apparatus, and, at the outset, the same potentialities. The same surroundings, the same time would doubtless convert a Patagonian into a Plato.

The first speech-sounds were doubtless due to reflex action of the speech-apparatus, responsive as it was to the many impressions from without. These speech-sounds were also of full content, and not at all comparable to the cut-and-dry, labelled sound-groups that we call words.

Sentence-words were the units of primal speech. The so-called parts of speech were not yet differentiated. Anyof them, and, it may be, more than one at a time, was immanent, proximately or mediately, in any sentence-word. The latter was a sort of phonic nested spide.

Usage and reflection isolated sentence-words of similar application. Grouping would supervene, and a slow, a severely slow development would doubtless in the end produce material that could be delineated in grammatical terms.

Rising thought and a working knowledge of speech-craft must have made plainer the boundaries of these groups, and more sharply marked off their members from the members of other groups. It may very well have been the generalisation of phonic elements in master-words, phonic elements that may or may not have once represented a full idea, or the adaptation of phonic flourishes existing in what was presumably often a song-speech, that has furnished the material and the scaffolding of subsequent inflectional upbuilding.

Roots, as independent, spaced sounds, have been got at by analysis. They existed in the first speech in posse, but not in ess. Nobody ever talked roots in the usual sense of the word. They are only phonetic types, vocal ideas, sound-pictures without a setting. Nobody ever saw in growth a nutless kernel, or a pithless stem, nobody ever saw a live skeleton.

The first words to be sure were not abstracts but concretes, and were predicated only of the objects, feelings, and phenomena of the daily life. Metaphors were in vogue early enough, abstracts were a late aftermath. No one can accurately describe the character of the Urrwirler without bethinking him of the character of the Urrmensch.

After having defined the first words in terms of their

bethinking him of the character of the Unmensch.

After having defined the first words in terms of their character, it is expedient to define them in terms of their origin. What is the term that best describes the first words as created things? Initatine, I think. By this I do not merely mean that cries (the pool pool theory), and initations of natural and animal sounds (the bow wow theory) furnished portions of the primitive vocabulary of man, but that this in its entirety consisted of reproductions or reflexions of the sounds heard by him or made by him, of the vocal murmurs and functional noises that were repeatedly in his next.

I do not then think it right to say that there was no necessary connection between impressions and names. The name certainly reflected the impression of the namer. Impressions were not always full and square, nor even, such as they were, all caught. This may account for the variations in the names of familiar sounds.

The creative stage in language has not passed. Paul in

The creative stage in language has not passed. Paul in his Principles gives crowds of words of imitative origin that have been developed in later German. I do not believe that the real first words were as much as I have just said. Set sounds did not come to order. There must have been many attempts and many failures, and the gamut of stable, intelligible sounds was probably not faticular in commass.

It seems to me that one of the most powerful aids towards the production of articulate sounds must have been got from the vocal accompaniments of joint action, and from the choric recitative of festal gatherings. It was to the cries of men working in fellowship and co-operation (the yo-he-ho theory) that Noire traced the beginnings of all speech.

In this connection I may mention an able article entitled 'The Festal Origin of Human Speech,' contributed by Mr. J. Donovan to Mind for July 1892, in which, with words of weight, he argues that articulation had its origin in the impassioned intonations of festal excitement. In the same article, if I understand him rightly, he throws out the suggestion that inflexional machinery may derive its origin and its scope from some sort of suffixal sing-song that attached itself to the chants celebrating diverse actions of scenes.

Mention should also here be made of the part that gesture played in the development of speech. It aided in making speech articulate and intelligible. Had man not been an erect animal, with free hands, he would never have possessed language proper, nor, for that matter, any means of effective communication. Had he not elected or been constrained to employ his hands fully in other ways, gesture-language might perhaps have sufficed for the wants of the early man. As it is gesture-language and speech proper went hand in hand, and it was long till the latter could dispense with the former.

Speech, as speech, cannot be called a scientific process, until set sounds with an established meaning can be produced at will, to be readily apprehended by a second individual.

The earliest sounds used by man for communication were probably in the main manufactured on the spot for the needs of the moment

When man in his communications with man was able to string a number of sentence-words together with a running cord of connection, he may be said to have passed, intellectually, the border line, whence, if progress had been arrested, man might have reeled back into the beast.

I am well aware how slight and fragmentary the above sketch of the origin of speech is. Nevertheless I have deemed it advisable to set down something on this important topic.

CHAPTER I.

LETTERS-THEIR ORIGIN AND ORDER.

Sounds and not letters are the units of importance in language.

The time, however, occupied in the invention, development, and transmission of letters, has been so long, and their history is so bound up with the history of civilisation, that for these reasons alone, leaving out of count their claims as sound-symbols, some little space ought to be set apart to note points of importance and interest connected with their study.

In this chapter the intention is to say just as much about letters as the heading indicates.

Before letters, the art of wiriting existed. It was picturewriting, by means of what are called hieroglyphs, representing at first honestly, then conventionally, the objects described. All systems of writing have had this natural origin.

The next stage in the art of writing was the use of the hieroglyph to represent not only the form, but also the name of the object described. The symbol, having gained recognition as a sound-carrier, was then used to represent similar-sounding names.

Next, and naturally, but not soon, it stood for the first syllable of the name: finally, with a progressive people, it became an alphabetic symbol, standing for the sound of the first letter of the name.

It is as if we were to make a picture of the beetle represent, first, the animal, then the sound of its name, then the sound of keetle 'hammer,' then the first syllable, and finally, the power of the letter &

The systems of picture-writing (omitting notice of savage systems) known to us are (1) the Egyptian, from which our own alphabet has ultimately come; (2) the Miscian; (3) the Cunciform; (4) the Hittite; (5) the Chinese. Alphabetic symbols have been evolved from all, save the two last. From these have been developed syllabaries, the Cypriote and the Japanese.

We got our alphabet from the Romans, the Romans got theirs from the Greek colonists of Cumae and Neapolis, who came originally from Chalcis in Eubea.

In our school histories of Greece we have all read that Cadmus the Phoenician brought letters to Greece. All the classical writers, from Herodotus to Pliny, affirm the Phoenician origin of the Greek alphabet.

In this case tradition and fact are at one. The Greek alphabet is undoubtedly of Semitic origin. One has only got to compare the names and the numerical values of the letters in the Greek and Hebrew alphabets to become convinced of this. If, after inserting the vau, san, and koppa that the blanks in the numerical values of the Greek letters require, we compare as far as tau—the last letter of the primitive number—we shall have visible proof of the strong correspondence.

All existing alphabets, moreover, come from the Semitic, not only the alphabets of the Semitic area, not only the Greek (and Italic) alphabets, but those of India (probably through the Sabean alphabet of Arabia Felix).

The next question is—Whence did the Phoenicians get their alphabet? Did they invent it? The ancients pretty confidently believed that they got it from Egypt.

It was the Frenchman De Rougé who first (in 1859) actually proved the Egyptian origin of letters. Avoiding the mistakes of his predecessors, who, attempting to affiliate the Semitle characters to the Egyptian hieroglyphs, had been baffled by the dissimilarity in form (to say nothing of disagreement in names, order, and number) of the letters of the two alphabets, he sought for the prototypes of these Semitic characters in a cursive script that was of suitable date (viz. that of the Semitic occupation of Egypt), and that possessed forms fairly similar to the forms compared. This he found in the Hieratic script of the early empire.

Selecting from this as exhibited in the handwriting of

the Papyrus Prisse (a MS. brought from Thebes to Paris by M. Prisse d'Avennes), the characters that were alphabetically used, he compared their forms with those of the oldest available Semitic characters (the Moabite stone was not discovered till 1868), viz., those on the sarcophagus of Eshmunazar, King of Sidon. He was able to trace nearly all the Semitic letters to originals among the Hieratic normal symbols. For refractory letters he was also able to give explanations.

Many of the outstanding differences between the forms of the letters in the two alphabets are due to the material used in writing. The Hieratic letters were written on papyrus with a brush-pen, the Semitic letters were written in stone with an iron pen. The alphabet, then, such as it was, was horrowed from the Egyptians during the dominion of the Hyksos, or Shepherd Kings, a Semitic stock, about the 19th eentury n.c. These on their expulsion diffused it over the zone of their influence, but previously and afterwards it was diffused among those with whom they had trading relations by the Phoenician colonists who had settled on the Delta during the Semitie occupation, and had remained after it cased.

The Semites, rejecting non-alphabetic elements, renamed, rearranged, and adapted for phonetic purposes. the letters they had borrowed. The letters have often been renamed since.

The Greeks, after adopting the Semitie alphabet, evolved characters out of the breaths and semi-consonants to express wowels, thus contributing their share towards the perfection of the alphabet. Semitie has no true vowels; in the primitive Egyptian the vowels were to a large extent inherent in the consonants.

The force of the above argument seems to destroy all chance of proving the Semitic alphabet to be of home, growth. Besidea, alphabets, like civilisations, have not been begun, developed, and perfected by one race, and within one area, at all sorts of odd points on the earth's surface. Transmission is the antecedent probability if the conditions are forcumble.

Attempts have been made to derive the Semitic alphabet from the Assyrian cunciform, but as yet no plausible case has been made out.

To tell why the letters of our alphabet appear in their

present order rather than in another, it will be necessary to refer to the Semitic alphabet. Beyond this it will not be necessary to go, for, as we shall presently see, their present order is of Semitic undrowth.

For this purpose, let us look at the letters of the Hebrew alphabet. Transliterated they run as follows :- 'a, b, g, d, h, v. z. ch. t. v. k. l. m. n. s. 'a. p. s. a. r. š. t. Their names are aleph, beth, gimel, daleth, he, van, sayin, cheth, teth, vod, kaph, lamed, mem, mun, samekh, 'ayin, pe, tsade, goph, resh, shin, tau. They exceed twenty-one, the third multiple of seven, by one letter. The positions of a, s, and s, are noticeable. They occupy, if k be placed beside a (of which letter it was originally a homophone, but became differentiated), the seventh, fourteenth, and twenty-first places. sacred places according to Semitic notions. If we now read over the letters, omitting the four sibilants, a certain method in arrangement appears to be present. Neglecting then s. s, s, and s, and also k and r, variants of q and l, we have four breaths, followed by several letters of one class, viz., 'a by b, g, d: h by v, ch, f; y by l, m, n; 'a by p, q, t This seems to afford a clue to the arrangement. Evidently the classification is according to sound, as in the Sanskrit alphabet.

There are other classifications of alphabetical symbols, viz., according to form, name, or date of introduction. The modes of classification have been called the phonological, the morphological, the ideological, and the chronological. The position of the Greek letters of later origin— $s, p, z, \psi, s \longrightarrow at$ the end of the alphabet is one of the best examples of chronological order.

We may expect that the facts before us will not all be

explained by one of these modes. But let us first tabulate what we have ascertained-

					:_		
	'n Br		Brea h	ths	у		'n
nts.	ь	ants	Lab v Pala		ds W	sp	P
Sonants	g	Continuants	ch Den	tals	Ē.	Surds	q .
	đ	٥	Pala ch Den		'n		t
				lant			š

Here we have alsy's followed by three sonants, he by three continuants, yed by three liquids, and ayin by three.. surds, while to each of these groups there can be conveniently attached a sibilant. A cross reading proves too that the consonants after the breaths follow one another in the order of labilate, palatals, dentals.

It may fairly be argued that we have before us the original arrangement of the Semitic alphabet, and that based on phonological principles. If we suppose then that the introduction into the alphabet of the new letters k and r—k beside is original g, by right of descent, and r beside s, by name-association (reat 'head', beside shin 'teeth)'—spoiled the harmony, and brought about a new arrangement in which z, s, and x, were to have the seventh places, we get an order that is almost identical with the received order of the Hebrew letters given above. By name-associa-

tion, & was afterwards placed after y-kaph 'palm' after yod 'hand'-and m beside n-mem 'water' beside nun 'fish.'

No explanation is given in the authorities of the place of s in the received alphabet. The real meaning of tsade is not known

A very few considerations have enabled us to see how the received order of the Semitic letters has been evolved from the primitive phonological order.

The order of letters in the Greek alphabet, which up to tau, corresponds closely with that of the Semitic, is of course explained by the explanation of the other. The letter tsade, Gk. san 'sampi, was lost out of the Greek alphabet, but was afterwards reintroduced to denote the numerical value goo. The loss is evidenced by the sudden break of identity in the numerical values of the Greek and Semitic letters. Among these, pi and pe both stood for 8c, while in Semitic, 90 was denoted by tsade, and in Greek by koppa, used only as a numerical sign. The corresponding letter in Semitic, viz., qoph, stood for 100, a clear proof that a letter had forpped in Greek.

The English order of letters is explained so far by the explanation of the order in its prototypes, but, adopted as it has been from the Latin alphabet, some details need to be added anent certain special features of the latter.

It will also be convenient to insert here and there, as the case requires, facts of interest in connexion with the Greek alphabet.

The Latin alphabet, as has been already said, was got from the Chalcidian colonists of Cumae and Neapolis. These used what is called the Western or Hellenic alphaset, and transmitted it to the Italians. The alphabet that ultimately prevailed in Greece during the classical period was called the Eastern or Ionian alphabet.

Let us then, by way of fully accounting for the English order, notice the differences that exist between the Greek and Latin alphabets. In the Latin alphabet, we have cin the third place, and

in the seventh e, while zeta has disappeared. Gamma was written as c in the Chalcidian alphabet, and this character. as records prove, had originally the value of a soft mute, but, owing it is said to the influence of Etruscan, which had not soft mutes, got hardened, and thus became synonymous with & (compare Chap, VII. p. 1712) After a while, & a letter with which certain Latin words continued to be written, dropped out of general use, and crepresented the sound of both k and g. Later on a differentiation of c. seen in our capital letter G, stood for the soft sound, and took the place in the alphabet that had been filled by the seventh letter zeta, the sound of which was not needed in Latin. Vau (F. called digamma, from its resemblance to two gammas superimposed) the sixth letter, which in the Eastern type of Greek alphabets had only a numerical . value, kept its place in the Western, the parent of the Latin alphabet, but took on it the power of f. Its former nower was se.

The Greek eta and the Latin H have the same position, and the same form, but different values. In the Semitic alphabet, the eighth position was filled by cheth with the sound of ϵh in Scotch loch, but in the Greek alphabet this sound had been reduced to that of the aspirate, thus taking the place of the fifth letter he, out of which the vowel epsilon had been evolved. At first, the sounds of epsilon

and eta were both denoted by E, finally, H, after doing double duty for some time as the representative of both eta and the aspirate, was set apart to denote eta, while out of the first half of a halved H was evolved', the sign of axpiration. From the other half was evolved'. The characters for theta, phi, and chi, were used in Latin only for symbols of numerical value, though in Etruscan they had a position in the alphabet. Theta furnished a symbol for 100, which was afterwards accommodated in form to the initial letter of centum. From a variety of chi was evolved L, the symbol for 50, from phi, a symbol, which was afterwards confused with the first letter of mille. Psi and omega do not occur in the Chalcidian alphabet, from which the Latins got theirs.

In the Greek alphabet, which originally ended with r, characters were obtained for the representation of $\rho_1 \gtrsim V_c N_c$, by differentiating existing symbols. Φ was obtained, through intermediate forms, and by differentiation, from the character for theia, not at all an odd proceeding, if we remember how frequently f and th have been interchanged. To represent the sound of theta, by the bye, the Greeks in adopting the sign for the Phomician teth, made use of a character that stood for a sound quite foreign to their own tongue. A character forth, originally represented, as was pile, by writing the tenuis and aspirate, was got by differentiation, from K_s , for psi, by alteration of phi, and for omega, by a modification of capital omicron.

It is well to remember that the Greek characters so familiar to us are quite modern minuscule developments of the eleventh century.

In the Western type of the Greek alphabet, from which

the Latin alphabet was derived, the sound called samekh in the Semitic alphabet, which in the Eastern type had, while keeping the original form, developed its sound to α , sided off into two sounds x and x. The first of these had already representation in the alphabet, and was soon discarded, retaining only numerical value, the second, was as a new letter transferred to the end of the alphabet. Koppa was retained in Latin, and, with the addition of n represented the velar guttural.

Out of vau there was developed not only F, but a vocalized F, written V or in Latin V. F retained the place of the present letter, while V was relegated to the end of the albhabet.

The sound of V in Latin was m, the dental sound of the English σ being probably not present in Latin and Greek. The stopped character of the consonant is, according to Taylor, proved by its name in Latin, viz_c , vc, for, had it been a continuous consonant, it would have been called ro, on the analogy of c_f , c_i , cm, &c.

The position of Y after τ in the Greek alphabet proves it to have been the first of the additional letters.

The differentiation and transference of X has been already spoken of.

The character V was introduced in Cicero's time to furnish a distinct sign for the Greek upsilon, which had formerly been represented in Latin by V, the equivalent of ω .

Z was reintroduced in the first century a.c. to transliterate Greek words.

U (orig. the uncial and cursive form) and V (orig. the capital form) were made separate signs about the fifteenth

century A.D., V (a favourite initially) being chosen to represent the consonantal sound. W (a ligature of two v's) appeared in the eleventh century. I was manipulated by way of

ornament at the beginning of a word, and provided with a little addition on the left side. This differentiated form, J, was set apart to denote the consonantal sound.

was set apart to denote the consonantal sound.

In the same century Z was taken into the English alphabet, to which it hardly belonged, from the French.

It is decidedly worth inquiring why we say a, b, c, &c., instead of using a reverse, or zig-zag order, and Taylor's account, as just given, seems convincing.

It is not the business of this chapter to trace the connexion between the various types of letters that have been used to represent sounds, nor is it its business to compare the primal types with the original prototypes.

Graphic developments within the same hand are usually exaggerations of special features, and used either for pure ornament, as in Black Letter, or utilised for needful differentiations, as with the left turn of j, really an ornamental j.

The dot on i was originally (the capital has none), in the shape of an acute accent, a diacritic, to help reading in such cases as m, ui; in, ui; v, ii, The dot is needlessly retained in j, thus proving the origin, and the date of the origin, of that letter.

Punctuation is now mainly logical, but at first was perhaps an attempt to mark the sentence-accent.

CHAPTER II.

SOUND RELATIONS IN INDO-EUROPEAN—VOWELS AND DIPHTHONGS.

The number of sounds that used to be allotted to primitive European was strictly limited. Especially was this so in the case of vowels. The scan number of rowels in Sanskrit was supposed to reflect correctly the condition of the parent-speech. The primitive vowel system would probably have been put down thus:—Vowels: a, I, i : Diphthongs: ai, au; Semi-vowels: p, o.

Consonants were proportionately meagre. Under guttural were put down k_i , g_i , g_i , under dental, l_i , d_i , dh; under labial, p_i , b_i , b_i , under sibilant, s; under liquid, r_i , m_i , n_i . Vowels and consonants together gave twenty sounds.

Now-days we have some thirty-nine sounds allotted to primitive Indo-European. It is felt that there is nose of reason for denying to the parent speech the richness in sounds that is the property of many later languages. Only the promptings of a false analogy, or the craving for an unnatural unity, could have induced another belief. Why should not the parent-speech have had wealth and complexity of sounds? Language even at its first beginnings must have had a fairly large capital of sounds.

Is it likely that primitive man with his large powers of mimicry, remained, amid the myriad sounds of his surroundings, so unimpressionable, as the scant stock of sounds summarily assigned to the parent-speech would lead one to cuppore, and this too at a time when the munners of shought and desire, such as these were, must have been expressed to a certain extent by tricks of sound? Would not this vacal range be afterwards reflected in the number and variety of speech-sounds, any later simplification being the result of a long period of wear and tear.

But there is no need to weigh probabilities. The sounds of the parent-speech can be got at by the dry light of inference. The sound-systems of its various families have simply to be compared and reasoned on. These families are the Indio-Ironian, the Armaian, the Greek, the Albanian, the Indio, the Kelik the Telutoin, and the Letto-Sknie.

A comparison of the sounds found in these, has led to the assignment of the following sound-system to primitive Indo-Luronean:—

Vocalie

Vowels: ă, č, ô, I, ă. :.
Diphthongs: ăi, či, ôi, du, ču, ôu.
Indeterminate vowel: 2

Consonantal.

Semivowels: j. y.
Consonant-wowels or Sonants: f, f, d, d, d.
Spirants: j, v, s, s.
Liquids: r, l.
Nasals: m, n.
Explosives—
Labials: s, b, sh, bh.

Dentals: t, d, th, dh. Palatals: k, g, kh, gh.

Velars : ke, ge, khe, ghe.

Some deny a place in the list of vowels to i and u, pronouncing them transformations of ci and cu, through intermediate and of course derivative i, \bar{u} .

In addition to the labial and dental nasals mentioned above, there were also yelar and palatal varieties.

There was also a \vec{u} , or modified u, in the parent-speech.

On comparing the new list with the old, it will be seen that the former has included e and o in the number of primitive vorels. These used to be considered, under every condition and in all circumstances, European weakenings or colourings of a, and by no means entitled to rank with the sacred triad a, i, m. The part played by these vowels in Sanskrit vocalism was the cause of this belief, and doubtless the simplicity produced in the Gothic vocalism by the replacement of e and o with i and a, strengthened this belief. All this has been changed. The connipresent a of San-

skrit has been diagnosed to be a late levelling, and decomposed into a, c, a. Curtius had, it is true, discovered that the European languages in similar circumstances have c, but not to the same extent a, in common.

It can be proved that a in many cases is not a primitive vowel. Nothing is more certain than that the second a on ranylau (Sk. ptifihn), taken with the p_i is a Greek fashion of writing the Sk. rr- vowel. The insertion of an auxiliary vowel to facilitate pronunciation is often urgently required. The combination—consonant-vowel and parasite—was then generalised, and used where a positive phonetic need did not exist.

In the face of this, it is manifestly absurd to call the e and the e of, say biprepar and bibera, modifications or splittings of an a, seen in bibera (St. dafram), which is in this case merely a ghost-word. Just so the a in Balan (for 13/40), having only, one might say, an auxiliary existence, cannot be the sound from which has radiated the s and e seen in Bibe, and Bold. A comparison of value (for variety) and rate; with rate; (for vare-)—the nasal word is written a in Greek, as may be proved by putting side by side ixarie (for ixaries) and cantum—of vipus and valy with trapes (for irayes), leads to the same conclusion. More on these valleds liquid and narsels later on. In these words then.

Further, it can be shewn that a, in Sanskrit, often functions as a palatal vowel would do in the circumstances, and that, in such cases, e appears in Greek, and generally in European.

and a have an independent existence.

Before the a of the reduplicated syllable in Sanskrit gutturals are palatalised, k appearing as c (the palatal, sometimes written ch), g as f, &c. For example, the perfect of the root kar 'make' is cakhra, and the only possible explanation is, that, while the second a is the ordinary back-vowel, before which the guttural is stable, the first is a front vowel, presumably e, before which the guttural is palathised. In support of this, there is the fact that in Greek the vowel of the reduplicated syllable is c. Precisely the same explanation holds for the palatal of ar (Gk. rr, L. que). These are only two of many similar instances. It appears then, that not only is a in European not always primitive, but that, in Sanskrit, it is sometimes demonstrably e, or a, as it is sometimes written. The vowel e must be admitted to

have as high an antiquity as the vowel a. The primitiveness of e involves that of \dot{e} , and the diphthongs ci and eu.

The proof that establishes the priority of c, also establishes that of a. They have always, so far as transmitted evidence goes, co-existed in verbal and nominal formations of established position and primary build, both singly, and in combination with semi-vowels and sonants.

A correct estimate of the following facts ought to establish the priority of o (\bar{o} , oi, oo). To get these, extract the ablaut-rowels from bipsyam bipsyam, bipsyam bipsyam, bipsyam, bipsyam<math>bipsyam, and place beside these the corresponding primitive vowels of Teutonic. Thus:

	Greek.	Teutonic.			
I.		-	e : a		
II.	η:ω	-	ē : ā		
III.	a : ā	-	a : ā		

Teutonic replaces o by a, and ω by \bar{a} . The sound \bar{a} from both originals afterwards passed into \bar{o} .

Assuming that the priority of s and s has been proved, does any one believe that the a and s are other than primitive? Is it likely that relations so manifestly organic' over their existence to a sentimental setting of the so-called splittings of a? One had much better be true to the symmetry, and pronounce s and s as original as their-correlates s and s. The e and o ablaut has quite as distinctive position as the a and \bar{a} ablaut. It is plain from a comparison of the two tables, that the a: \bar{a} ablaut is a thing apart and standing by itself.

In this connexion it is proper to remark that Armenian, a language usually classed as Asiatic, has a short e and e. but perhaps we ought to class it among the European languages, or call it a link between Asiatic and European.

There is good reason then for declaring the European vowel-system to be more primitive than the Indian. We may either say that e and o in Sanskrit have been levelled under a—in an open syllable, o is in Sanskrit represented by \bar{a} —or that a is a graphic expedient to denote what had better have been denoted by another sign. In scientific language e, o, a, are sometimes written a^1 , a^2 , a^3 ; e and o, a^a and a^a . (See page 140).

What is in the new list called the indeterminate vowel, and represented by the current symbol for an obscure vocalic sound, viz., a turned e, appears in Sanskrit as i (as a before i-vowels). In European languages, this vowel was levelled under a. For an example take Sk. pitā, Gk. \(\pi\tau\tau_i\teta_i\), L. pater, Goth. fadar, O.H.G. fater. In Greek, the analogy of strong e- and e-forms sometimes brings about the intrusion of e and o instead of the usual \(a-\text{irig}\) (L. \(\text{shtus}\)), \(\text{brit}\), \(\text{brit}\) (L. \(\text{shtus}\)).

The next addition to the original list is furnished by the presence of the lingual and nasal consonant-vowels τ , ℓ , m, m. These are also collectively called sonants, or subdivided into syllabic liquids— τ , ℓ , and syllabic nasals—m, ℓ . Their sounds are heard in the English words butter, bottle, buxom, button. The full consonant equivalents of these are heard in butterine, bottler, buxomer, buttoner.

All the consonant-vowels have not separate characters. Sanskrit represents, with variations, r and l by the ri- and li-vowels. The nasal vowels in Sanskrit, and both sets of vowels in other languages, are represented by the ordinary

nasal and lingual consonants, preceded, or, as in Greek, followed by a developed inorganic vowel. Of these sounds there are short and long varieties. For their representation, consult the table of sounds. Examples will be found in the commentary.

It will be seen that in the present list of primitive sounds the place of the old simple guturals is taken by two rows of consonants called respectively palatals and velars. The palatals are formed by the action of the tongue against the hard palate, the velars, by its action against the relum palati or soft palate.

In Latin, Greek, and Celtic, the palatals are written as simple gutturals, but appear in Sanskrit as f(p, j, l, l/it) h. f is called the palatal sibilant in Sanskrit grammars, and is set down with the pronunciation sh. In Brugmann's grammar, the characters used to represent them are k, g, gh (with small arch over guttural). k (Sk. f) has become a sibilated spirant in Sanskrit f all three (k, g, gh) have become "sibilated spirants in Zend, Letto-Slavic, and Armenian.

The velars appear in Sanstrit (and Zend) as simple guttarals (or palatalised gutturals), without any labial modification, as also in Armenian and Letto-Stavic; in Greek, their treatment is twofold, and will be alluded to presently; in In Latin and Teutonic, they often appear with full labial modification—qutis, Goth. https://

In Greek, Latin, Teutonic, and Celtic—not necessarily in all three at once—the velars, however, also appear as simple guturals, and sometimes, as in the question, 'hard palatal or hard velar,' it is only by a comparison with Sanskrit that we can determine to which row of gutturals the sounds under examination beloag.

In the foregoing list the velars have been set down as k^{u} , g^{u} , gh^{u} . Brugmann writes the hard velar as g, and uses a modification of g to represent the soft velar.

In Sanskrit, the velars are palatalised before i, and before a, corresponding to European c, and represented in writing by c (ch), j, (jh) h. These are called palatals in Sanskrit Grammar. The characters j, and (jh) h, thus represent both palatals and palatalised velars.

After these remarks on the general representation of palatals and velars, it will be necessary to notice one or two particular transformations to which velars are subject in Greek.

Before o-vowels, before lingual and nasal vowels, before liquids and nasals (and before τ , θ , θ), the velars become—rounding was induced, and lip-stoppage substituted for back-stoppage — respectively by action of the labial element π , θ , φ , e.g., $i\pi\nu\rho\omega$ (L. sequor), $i\pi\nu\rho\omega$ (water for washing' (Sk. niktás 'washed off'); $\beta\omega n\omega$ (L. veniō I.E. $g^{\alpha}n\eta$ 0); $\varphi\delta m\varphi$ (Sk. ghadnit' they strike'). These transformations used to be called labialisms, and explained by the supposed intrusion of a parasitic n.

Before i, e, the velans become respectively τ , δ , δ , e, e, e, ϵ , ℓ . (L. quts); $\delta k \lambda p \psi$; womb' (Sk. girbhas, A.S. ceaff 'cali'), $\delta k p \psi \delta \epsilon$ (L. formus). In $\tau l \epsilon$ &c., the velar guttural has been drawn forward by the front vowel to the dental position. Compare the change wrought on the original initial velar guttural k^{g} in Sk. cakr ds (Gk. $x \psi x \lambda \rho \delta \epsilon$ ($x F x k F \lambda \rho \delta \epsilon$), A.S. h w e e e e, $e k k k k \ell \delta \epsilon$). It must not be supposed however that this Sanskrit palatalisation, and the intermediate palatalisation that is to be inferred in the paisage of k^{g} into τ in Greek, were synchronous, for the τ only appears in words that have congeners with σ ($\tau l \epsilon$ and

cérspes). The labial after-sound must then have been felt, and the attracting force of the succeeding front vowel have been exerted despite the existence of said sound. There must also have been some peculiarity about the pronunciation of these labialised gutturals that rendered them liable to be thus acted upon, for velar & without labial modification remains even when followed by a front vowel.

The last named transformations of original velars in Greek used to be called dentalisms, and explained by the intrusion of a parasitic i.

The subject of palatals and vélars is such a hard one, that the subsequent tables will to a certain extent be anticipated, and some of the main facts relative to their representation be set down at this point.

	LE.	SI	Ł.		Gk.		I		Ter	ut.
	k	ś(ç)		×		c .		, pr.,		
Palatals	g	j		γ		g		k,		
_	gh	h .		x		h;g		g		
Velars	kii	k	c 5	- 4	7 ;	odification	qu,c	ifcation .	hw	P in
	EB	g	intalised w	clars before 4.	velars before 1. 4	7 4		r labial mo	kw	Without fabial modification
	ghl	gh	(jh)h	P	i	without 3	gu,v, f,b	P'U	(g)w	g although

The hard aspirate velar k/k*, without labial modification, is seen in Sk. śankhás 'conch-shell,' Gk. κόγχη 'mussel,' L. congius 'quart'; and, with labial modification, in Sk. nakhás, Gk. δωξ, L. unguis.

It ought to be stated here, that, in the parent speech, there were perhaps two varieties of palatals—one, the pure palatals, the other, the sibilated variety appearing in Sanskrit, Zend, and Letto-Slavic.

Sometimes, in words which had a velar in Indo-European, no trace of the labial after-sound is found in any of the labialising languages—Gk. zörös, L. cutis, A.S. höd, O.H.G. hät (G. haut).

In these cognates, however, the absence of the sound in question can be accounted for, since u disappeared before u in these languages.

With regard to the non-labialisation of certain languages, there are as yet no definite data to decide whether this feature was in them from the beginning, labialisation being a special, self-developed characteristic of the labialising languages, or whether an originally common process became narrowed in its sphere of operation.

Perhaps the ordinary labialisable velar, and the unlabialisable velar of Sanskrit, Zend, and Letto-Slavic, may represent two varieties of velars. It is odd that the languages which sibilate the palatals have no labial modification of the velars. Were these sibilating and non-labialising peoples neighbours in the original habitat? Not that this one agreement entitles us to postulate original uniformity in other particulars. It is also to be noted that in the non-labialising languages there is sometimes an interchange between palatal and velar explosives.

It falls now to state in tabular form some of the principal correspondences that obtain between the sounds of certain representative Indo-European languages, viz., Sankrii, Greek, Latin. Gethic. Anglo-Saxon, and Old High German.

The commentary registers certain noticeable representations that are not always noted in the table. For further remarks on Anglo-Saxon vowels, consult Chaps, VIII. and IX

This is perhaps the place for a little historical matter anent these languages. Sankrit is one of the Aryan languages, the others are Zend and Old Persian. The name is properly applied to the literary language of the learned and priestly class. The volgar dialect was called . Prākrit, and from it have come the present languages of India. Greek is a general name for three dialects, traditionally known as Dorric, Zenkr, and Jonic.

The Trutonic languages were divided into two groups, East Germanic and Viers Germanic. The members of the first are Gothic, and Norse (Sweetis, Danishi, Norwegian, and Notalentic). Gothir means the language of the Visiters Goths of the Balkan Peninsula, into whose language Ufilias, translated the Scriptures in the fourth century. The second group is composed of Angle-Saxon, Old Privian, Old Sakon, Old Dutch, and Old High German.

Here follows the promised table:-

These Indo-European sound-correspondences will now be illustrated by examples taken from each of the languages it. "tretion. The very possibility of a tabular statement it a lies, and consistency no less than brevity demands, that

tuese illustrations be furnished by cognate words. Certain main transformations that the original sounds

unders o in the various languages will at this point, as a rule. he simply referred to as illustrations of certain well-defined sound-processes. In another chapter (V.) will follow definitions of these processes. It will however, be well to give under each sound such explanatory matter as cannot well be

held over, or can there be most conveniently given. a : Sk. ciras ' plain,' Gk. aypis, L. ager, Goth. akrs, A.S.

arer, O.H.G. achar (agros). Sometimes i appears in Sanskrit, instead of a. Take as

an example pitar- (Gk. warte). In this word, the a represents the indeterminate vowel, which appears in European

For the replacement of a in Latin by e, i, and u, take as examples confectus (facio), recupero (paro), jude (100);

mancipium and mancupium (capio), insilio (salio), adigo

(aco), attineo (taneo), insulto (salio). These replacements are found in unaccented syllables-e in closed syllables. before r, and when final: i or u (i.e. \bar{u}) before labials, before / in open syllables, and before ng: u before I followed by another consonant, but not before //.

In Anglo-Saxon a for a, as in acer, is found mostly in closed syllables, or in such as were originally closed, as acer (Goth. akrs); ea is due to breaking-eax (L. axis), or u-umlaut-cearu and caru. For changes wrought on ea by umlaut, see Chap. V. For an example of e, due to i-umlaut.

take ('g' 'edge' (L. acie'); for s, used interchangeably with a before nasals, take mpun, finally supplanted by mnum. There are two s's in Angio-Saxon—the last mentioned, open s (Goth. s), alternating with s, and a close's, from original s.

For an example of umlaut-e in Old High German, representing original a, take elbir 'swan' (L. albus). This umlaut however did not take place, if there intervened a consonant preceded by l.r. h-mahtim 'motibus'.

2: Sk. bhråtar, Gk. ppare, L. fräter, Goth. bröbar,

In Teutonic \bar{a} , was everywhere changed into \bar{a} , which passed into $u\bar{a}$ in Old High German, through the intermediate stages $a\bar{a}$ and $u\bar{a}$.

The ē that appears in Anglo-Saxon is due to i-umlaut, and may be seen in dat. brēver, or, if an independent word is wanted, in grēne 'green' (grēnon 'grow').

Final \(\tilde{\

n (a).

e: Sk. dzti, Gk. inri, L. est, Goth. izt, A.S. iz, O.H.G. ist.

Short e appears in Sanskrit as a. Sometimes i occurs in place of original e-mindi defect (L. menda).

For i in Latin, take as examples (a) in originally unaccented syllables—obitide (scales), agist (dyrer) (b) in closed syllables followed by nassla, notwithstanding accent—in, intut (is, irrse), guinque (cirrs). Perhaps i, to begin with, only appeared in in, when followed by a consonant. Then followed levelling of the e-form under the i-form. But in was usually proclitic and unaccented. Note also dignus (deep.) The i in the last word is long, in conformity with a law of the classical period, assigning length to every vowel before nf, ns, gn, gm.

Original e also appears in Latin as a—anguilla $(v_{\gamma \chi_k \lambda \nu_k})$, magnus $(u^i \gamma_{\alpha k})$, vas $(\tilde{a}^i - (F) v \tilde{b} \alpha_k)$, paleō $(\pi v r \dot{u} v \nu_{\mu \nu})$, flagrō $(v \tilde{b} \dot{r} \gamma \nu_k)$, mandisor $(i v r \gamma_k v \tilde{v})$; and as u, o—ulcus $(v u l c u v \tilde{v})$, $v \tilde{v}$ $(v \tilde{v}$

e remains before r— $fer\bar{o}$, double consonants—obsessus, and finally—agite ($\tilde{a}\gamma \varepsilon \tau \varepsilon$). Note seu ($s\bar{s}$ - $v\varepsilon$).

I.E. e was replaced in Teutonic by i (a) before nasals + consonant — A.S. bindan (Gk. civbepe father-in-law') ('connexion'), L. offendimentum 'chin-cloth' (bhendh) (b) before a syllable containing i, j, or i—Goth. ist, A.S. is, O.H.G. ist (Gk. iori) (c) before a syllable containing u —A.S. sibun, Goth. sibun, O.H.G. sibun (Gk. ierá) (d) in enclitic words—A.S. ic, Goth. ik, O.H.G. ih (Gk. iyrá), and unaccented syllables — Teutonic nominal suffix -is (Goth. agisa 'fear'), corresponding to Sk. -as, Gk. -es, L. -es.

At this point, the replacement of e by i stopped in West Germanic, but Gothic—Gothic and Norse represent the East Germanic branch of Teutonic—replaced every e by i, which before h and r again became a, written ai.

It is to be added also that, in Anglo-Saxon, original e before simple nasals, became i—A.S. niman, O.H.G. neman, Gk. νίμω. This change also took place in words borrowed at an early date from the Latin—A.S. gimm 'gem,' L. gemma, A.S. pinn, L. penna.

A good example of original e running right through is Sk. bhar, Gk. φέρω, L. ferō, Goth. bairan, A.S. beran, O.H.G. beran (bher-).

Besides original e, sometimes for distinction written e, there was another e, the product of umlaut. It is uncertain which of these was close, and which open. Sweet and Sievers give umlaute as an open sound. Wright, in his Old High German Primer, would have it that umlaute had a close sound. like the foroducing the umlaut.

al in Gothic is due to breaking, co in Anglo-Saxon is due to the same cause. For changes wrought on co by umlaut, see Chap. V.

ē: Sk. dhānam 'position,' Gk. bīsu, Goth. gadēļus 'deed, position,' A.S. dād, O.H.G. tāt (dho(k), L. faciō has reduced root).

Sanskrit replaces \vec{e} by \vec{a} . That \vec{e} did once stand is proved by the palatalisation it effected on the preceding velar before its disappearance—cp. Sk. $-j\vec{a}n\vec{t}$ 'wife,' Gk. $\gamma n\vec{b}$, Goth. $kva\bar{c}ns$.

s occurs in Greek in place of original ē—siw 'spin,' Goth. nēpla 'needle.'

ē, in Latin, is spelt as and os, as praelum beside prēlum 'wine-press,' and foetus beside fētus.

Perhaps owing to a following *i* or *i*, *ē* is in Latin also ⁱ represented by *i*, e.g., *delīniō* and *delēniō*, *subītlis* for *subītlis*, from *tēla* 'web.'

In Gothic, \tilde{c} was sometimes spelt $e\tilde{t}$ (arguing closeness)—
kweins beside kwēns. Sometimes, before vowels, an $a\tilde{t}$ (ap)appears for I.E. \tilde{c} —saian 'sow' (L. sēmen), waian (Gk. $\tilde{c}\tilde{t}(Pnuc)$.

In Anglo-Saxon $\tilde{\alpha}$ represents Teut. open $\tilde{\epsilon}$ (sometimes for distinctness written $\tilde{\alpha}$). The Old High German representation is \tilde{a} , and it is doubtful whether A.S. $\tilde{\alpha}$ has passed

through \bar{a} to its present state, or whether it represents the Text. long e-sound. There is another long e-sound, rather rare in its occurrence, close in quality, which is represented in Anglo-Saxon by \bar{c}_i in Old High German by a_i , i_i , i_i . This, like the first, is represented in Gothic by \bar{c}_i . Brugmann any that this close \bar{c} can hardly come from I.E. \bar{c}_i . For an example of this sound take Goth. $h\bar{c}r_i$, A.S. $h\bar{c}r_i$, O.H.G. har, him. his

Tent. a pppears in Anglo-Saxon as ā, before nasals—A.S., māna 'moon,' Goth. māna, O.H.G. mano, Gk., pām. This change, in Anglo-Saxon, of Teut. ā (West Germanic ā), into ā, will be a parallet to the change of a into ā in the two varieties manu and mann. Perhaps it was on the passage through ā to ā alluded to above that the nasalisation took place. This ā, the product of nasalisation, was in Anglo-Saxon umbatted to ā, as in cubā 'woman' (Teut. cubānh), bāā 'hope' (Goth. māns, O.H.G. wān), bāā 'heel' for hābālā (Cn. A.S. bāā 'hopeh').

- LE ē also appears in Anglo-Saxon, and in Teutonic generally, as i—A.S. wind; Goth. winds, O.H.G. wint (L. vēntu, Gk. ā(F)gas) (winte). Sometimes I.E. ē is shortened in Teutonic to ε, before liquid and consonant. This, in Anglo-Saxon, is broken to εφ, or, with i-umlant, appears as is, p—A.S. heoric, Goth. hairiö (al=broken ε), O.H.G. hera (Gk. πή) (kērā-).
- o: Sk. ashtāú, Gk. bzrú, L. octō, Goth. ahtáu, A.S. eahta, O.H.G. ahto... Short o in Sanskrit appears as a. In open syllables ā

Short σ in Sanskrit appears as a. In open syllables \tilde{a} appears— $\rho \tilde{a}ilam$ (Gk. $\pi \delta ilah$). Before a, representing original o, palatalisation did not take place, as it did before a, representing original c.

For example of w occurring in Greek dialectically for o take φύλλων (L. folium), κόξ (L. nox, Goth. nahts), μύλη 'mill' (L. mola, Goth. malan 'grind').

In Latin, o appears as u, e, i. In unaccented syllables, u is found in place of the older o—filius (filius), but the o is kept before r=s, and after u, u—temporis (tempezis), mortnes, viros (forms in -us late). u also occurs in accented syllables, especially before nasals—unuss 'hook' (Gk. 572sc), unuis 'ounce' (Gk. 572sc, 'bulk'), unubō 'boss' (Gk. 452sc, 'bulk'), unubō 'boss' (Gk. 452sc, 'bulk'), unuis o'unce' (Gk. 472sc, 'bulk'),

'navel'), unguis 'nail' (GL 5005).

c replaces o finally—sequere (Gk 5016), ille, iste (*ollo, *esto), and in unaccented closed syllables, or after i—hospes, for hostifies (botis), societal (socie).

i also represents o, in unaccented syllables—Ilicō (in(s)locō)

'sur-le-champ, auf der Stelle.'

vo sometimes becomes ve—venia (Gk. διλημι), vester and voster, verto and vorto.

Some say that on may pass into av-cavus (Gr. 1661 'excavations'), and (cp. Gk. 6(F)1606, 'bird'), .

In Teutonic, σ was replaced by α in all accented syllables, but probably remained extant in unaccented syllables before

In Anglo-Saxon, this vicarious a underwent all the changes of real a, viz., the change to ac, the breaking to ea, the passage by umlaut to e-hessel (L. corylus), heals (L. collum), meme 'neck-chain' (L. monité). For e in Old High German, the result of umlaut, representing o (O.H.G. al), take nystila 'band' (L. médus for medus).

 Sk. pātram 'vessel,' Gk. αῶμα 'lid,' Goth. fodr 'sheath,' A.S. fodor, O.H.G. fuotar 'case' (G. futter). Sanskrit replaces σ by a. In Latin a cognate is wanting. For original $\bar{\sigma}$ in Latin, take as example $f\bar{t}\bar{\sigma}s$ (A.S. $b\bar{t}\bar{\sigma}s$ tma). $\bar{\sigma}$ appears sometimes in Latin as $\bar{u} - f\bar{u}r$ (Gr. $\phi(s)$, $\bar{u}hns$ (Gr. $\phi(s)$).

In Latin as ti—fur (Six, φωρ), utina (Six, ωλινη).
Doth ô and ā were represented in the Teutonic dialects by ö, and underwent the same changes. As example of i unlaut of original ö in Anglo-Saxon, take dēman 'deem' (A.S. döm' doom').

For the genesis of no, as representative of \hat{o} in Old High German, see above under \hat{a} .

ē final did not pass into no, but appears in Old High German as n, and in Gothic as n—O.H.G. birn, Goth. balra (Gk. pin). In Anglo-Saxon, the nu was replaced by the optative termination n.

 Sk. vidhdvā, Gk. h(F)ih(F)e; 'batchelor,' L. vidna, Goth. widuwō, A.S. widewe, O.H.G. witnwa.

In Latin, e appears for i, before r (s)—serō (*sisō) and finally—ante (Gk. èrri). i final also drops —ad (Sk. édhi).

1.E. i becomes e in Anglo-Saxon and Old High

German, before an a or o of the following syllable, unless conserved by an intermediate i or i—A.S. nest, O.H.G. nest [L. nitus for nitatos]. This was not a very common change, and its wording for Teutonic is not quite certain. Levelling under related i forms also interfered with its operation. It occurred most regularly before r and A—A.S. new 'man' (R. newmolf). O.H.G. new (Teut.

wirac, wiroc) (G. werwolf), cp. L. vir.

This e was of course changed to i (and, like original i, broken to e, written ef. before r and h) in Gothic.

1: L. suimus, Goth. swein, A.S. swin, O.H.G. swin.

For Sk. i, take pītās 'drunk' (cp. Gk. 570), for Gk. i, take is (L. vis).

u: Sk. yugdin, Gk. Zvyb, I., jugum, Goth. juk, A.S. geoc (juc), O.H.G. joh.

In Gk. δλολέζω (L. nlula 'screech-owl'), a appears for u, v in Greek had once the sound of n (w), and this sound was kept for many generations in certain dialects—Broot. λγγωρές = Attic λγγωρές.

There is a change (dissimilation) of v to i in Greek before following v—zavris for zvoros (Sk. punāmi 'I clean.')

Before labials and l, u in Latin becomes i, or rather something between i and u (i.e. \tilde{u})—libet and lubet, lacrima and lacruma.

After I and r, u in Latin came to be written v—milyus 'kite' and milyus, silva and silva. It was dropt finally—red-(for redu, cp. indu.)

The at that appears in Gothic is due to breaking—datar (GR, blope). was broken to open o before r and h, and this written at. F umlaut produces y in Anglo-Saxon—gastar 'kiss' (L. gustā). The so of gree is due to the influence of the palatal.

I.E. u appears in Angio-Saxon and Old High German as o, before a syllable containing a or o, unless conserved by a following nasal + consonant, or an intermediate i or i—A.is. axa, O.H.G. obso (Sk. ukshd). This o was changed to u in Gothic and broken to at (open o)—athta.

West Germanic o usually remains in Anglo-Saxon, but before nasals u is found—genumen 'took,' O.H.G. gionenan, A.S. gama 'man' (E. (brid/s(r)pom), O.H.G. gomo (G. (brāuti)gam), Goth. guma. There are other examples of n in Anglo-Saxon—fuga' (O.H.G. fogal (G. vogel), Goth. fugil), rast (O.H.G. rost). ů: Sk. můsha, Gk. μῶς, L. mūs, A.S. mūs, O.H.G. mūs (G. maus). Just as v, at first pronounced u (νν), retained that sound dialectically, so v at first pronounced ū (νν) retained that sound dialectically—Bœot. Εδθομμές = Attic Εδθνμές.

The ω in $\sigma \delta \theta \alpha \rho$ (L. $\bar{u}ber$) is said to be due to a desire to avoid the double aspiration that the regular $^*b\theta \alpha \rho$ would present.

There is a change (dissimilation) of \bar{v} to $\bar{\tau}$ in Greek before a following $v = \varphi \bar{\tau} r v$ 'twig,' cp. $\varphi \nu \omega$.

For an example of \bar{u} in Gothic take $f\bar{u}ls$ 'rotten', A.S. and O.H.G. $f\bar{u}l$, (Gk. $\pi^{ij}\theta\omega$, L. $p\bar{u}te\bar{o}$).

The \bar{y} in Anglo-Saxon is caused by *i*-umlaut— $m\bar{y}s$ mice' (Teut. $m\bar{u}siz$, $m\bar{u}sez$).

ai: Sk. édhas 'fire-wood,' Gk. aïba 'burn,' L. aedes 'hearth,' A.S. ād 'pyre,' O.H.G. eit 'pyre.' a+i give in Sanskrit, by ordinary guṇa, ā. Since e and o

are written a, these followed by i will also give \(\bar{c}\).

Original ai in Latin was sometimes written \(\bar{c}\)—haedus and

Original ai in Latin was sometimes written e—haedus and hēdus (Goth. gáits 'goat'), saeculum and sēculum. ae was also misspelt oe, as in coelum, poenitet, coena, moereō, &c.

In originally unaccented syllables ai became i—inquirō (quaerō), parriādium (*parrus' open' (parrēre), cp. parra (avis) 'bird of omen,' and caedō). Notice also its representation by a and e in the following words—aēneus (*aēsneus (áges-)), prehendō (prae, hendō).

ai became ā in Anglo-Saxon—the second element, says Sweet, became e and was then absorbed—and this by -tumlaut passed into a—dēl 'portlon,' belonging to the i-declension, (Goth. dáils O.H.G. teil (G. theil).

In Old High German ai became ē before r, and finally-

stand.

mēro 'greater' (Goth. mdiza); wē 'woe' (Goth. wdi), elsewhere ci-scin (Goth. stdins 'stone').

āi: This is called the vrddhi diphthong in Sanskrit. $\tilde{e}i$ and $\tilde{e}i$ have the same representation.

The diphthong appears as a case-ending of the dat. sing. of ā stems—Sk. su(v)apatyūi, nom. su(v)apatyūi 'having a beautiful posterity,' Gk. χώρη, O.L. Matulā 'Matutae,'

Goth. gibái 'to a gift.'

āi is said to appear as ā in Old High German stān

el: Sk. tráyas (*trejes), Gk. τριδ; (*τριξ)), L. tržs (*trejes), Goth. þrefs (*þriξ)(þ.; *þrupes), A.S. δτί, O.H.G. ἀτί, Short e appearing as a in Sanskrit, et will have the same representation as al, i.e., č—blédáimi '1 cleave' (Goth.

beitan 'bite'). This e was resolved into ay before vowels.

In Latin ei remains in hei, and on oldest monuments—

deitē, feidē, but soon became an open i—ditē, fidē. It also appears as \bar{c} —lēvis 'smooth' (Gk. $\lambda \delta l(F) \circ \bar{c}$). Before a vowel it appears as c— $c\bar{c}$ 'I go'= $c\bar{c}$ (Gk. $\iota l \mu \iota$).

&i: For example in Sanskrit, take āis 'thou wast going,' impf. stem ēi (sj. 'go'). The diphthong was an infrequent one in Indo-European. It is seen in Gk. ωλώστες, Norse Ac(1)str' 'most' and Attir' 'more,' I.Ε. ρā-is- for ρδ-is-

fle(i)str 'most' and fleiri 'more,' I.E. plē-js- for plē-is-.

Wharton's explanation of plās takes us back to this diphthong:—plās = plās = pleus from plē-us, plē-jus.

oi: Sk. tế 'they,' Gk. τοί, L.(is)17, Goth. þái, A.S. నā, O.H.G. đē.

This diphthong will naturally in Sanskrit have the same. representation as ai, i.e., č.

For oe in Latin, take as example—foedus 'treaty' (Gk. σίσουβα), for ū (through ŭ)—ūnus (O.L. oinos), for ī—fidus (Ennius) for foedus.

Wharton says that pretonic oi, unless saved by analogy, appears as ae—caecus 'blind' (Gk. zoziλλω 'gape about' Goth. hdihs 'one-eyed').

oi has in Teutonic the same representation as ai, and undergoes the same changes. For & in Anglo-Saxon, the i-umlaut of ᾱ (orig. ai), take as example dēg 'clay' (Gk. γλοιοί L. glūten), and for ei in Old High German, take meidem 'stallion' (rather M.H.G.)—('ein schon lange veraltetes Wort,' says Weigand) (L. mūdō 'penis').

ōi: Seen in the instrumental plu. of o-stems—Sk. dśvāis, Gk. Ἰπποις = iππωίς. In Latin, this diphthong occurs in oloes 'illis,' from original -ōis. Final -ōi passed into -ō.

au: Gk. παῦρος, L. paulus paucus, Goth. fazvái, plu. (*fáus, sing.), A.S. fāa, O.H.G. fōhem, dat. plu.

a+u give in Sanskrit, by ordinary guṇa, \bar{o} . Since e and o are written a, these followed by u, will also give \bar{o} . For example of \bar{o} , take bjas 'power' (L. $auge\bar{o}$.)

In Latin, au in originally unaccented syllables appears as ū-inclīdō (claudō), also as oe or č-oboediō and obċdiō (audiō). au in accented syllables is also spelt ū-frūstum (Gk. θρωθω 'break'), and ō-ptōstrum and plaustrum, Clōdius and Claudius.

au in Anglo-Saxon appears as $\tilde{e}a$, of which the i-umlaut is $\tilde{t}e$, I— $liteav\delta$ and $litw\delta$, 3rd sing, pres. ind. of litava0 thew.' $\tilde{e}a$ is sometimes written in oldest texts ao, co, ao. Of the Anglo-Saxon transformations of this diphthong Sweet gives the following explanation:—"The a of au

became a, in accordance with the general tendency of the language, the second element being opened, and finally uncunded. It is probable that the first element remained a throughout the Old English period." The first vowel of this diphthong has accordingly the value of long a, viz., long low-front-wide. For the quantity of the first vowel in \(\tilde{a}_n \) see below under a.

an in Old High German passed through ao into \(\bar{c}\), before \(\delta_i\), \(\bar{c}_i\), \(\delta_i\), \(\delta_i\), \(\delta_i\), \(\delta_i\), \(\delta_i\), \(\delta_i\), \(\delta_i\), \(\delta_i\), \(\delta_i\), \(\delta_i\) and \(\delta_i\) before other consonants, and as final, it passed in the ninth century into \(\delta_i\)—ouga 'eye' (Goth, \(duv{c}\)).

áu : Sk. nāús, Gk. 140; (orig. 1645), L. nāvis.

ūu is called the vrddhi diphthong in Sanskrit.
ũu and ũu
have the same representation.

a: appears in Latin before a vowel. Before a consonant au is found—vaudeo (raixideo).

āk-appears as au in Gothic—sauii neut. 'sun' (Gk. ñihos for aāk-hos (p. 115), L. sāi, Norse sāi fem, and a sometimes quoted A.S. sāi. By the bye claudō for chāyidō originally had ān, ep. chāvis and skapis.

eu: Gk. γιδομαι 'taste,' L. gūstē, Goth. kinsan 'choose,'; A.S. ccosan, O.H.G. kinsn 'I choose' (G. kiesen).

There is no short e in Sanskrit. It is represented by a, consequently en will have the same representation as an, i.e., \(\bar{e}\)—\(\bar{e}\)dhāmi 'I perceive,' Gk. \(\alpha\)ielegan.

cn appears in Latin only in interjections—hen, otherwise as ñ. Note also the representation i (through ħ) — hiber (Gk. iλ.ιὐθιρε).

c being replaced by i in Gothic, en will naturally appear as in. With regard to A.S. \(\tilde{c}\) (co and \(\tilde{ca}\), (a) it will be well to quote Sweet:—"That the difference between ca \(\tilde{co}\), and \(\tilde{ca}\)

ēo was one of quantity, is proved beyond doubt by the accents, the metre, and the whole history of the language. It is certain that the stress was not originally on the second element, for au and eu were certainly accented áu, éu. The length must have been either on the first element, or else distributed over both. The former seems most probable. The lengthening probably began by an exaggeration of the glide between the two elements."

In Old High German, eu became eo, later io, when followed by a syllable containing a or o—biogan 'bend' (G. biegen), otherwise as iu.

ēu: Sk. dyāús, Gk. Zebs (orig. Znus).

The two letters forming this diphthong probably did not often occur in the same syllable in the primitive Indo-European language.

ou: Sk. bubådha 'he has waked,' Goth. báuþ, A.S. bēad 'bade,' O.H.G. bōt.

In Sanskrit, there is no short o. o is represented by a, consequently ou, like eu, will have the same representation as au, i.e., \bar{o} . ou remains in Greek— $\sigma\pi\nu\nu\nu\delta\dot{n}$ (pstond-). Compare $\sigma\pi\nu\dot{\nu}\dot{\nu}\dot{\nu}$ (pstend-), and L. $stude\bar{o}$ (pstud-). Note $zo(F)i\omega$ 1 perceive $^{\prime}$ (A.S. $ze\bar{c}ax\bar{v}ian$).

ou got mixed in Latin with eu, but can still be distinguished in Oscan, e.g., eastrovs, gen. sing. from stem eastru-'fundus.' ou appears in Latin as $\bar{u} - f\bar{u}dit$ (Goth. gáut 'poured,' A.S. gēat); līcus (A.S. lēah—E. lea), as $\bar{o} - r\bar{o}big\bar{o}$ and $r\bar{u}big\bar{o}$ (roudh., cp. $r\bar{u}fus$ 'red'). Both \bar{u} and \bar{o} are shortened in cloāca and cluāca.

ou originally pretonic appears as au—auris = ousis (Gk. οὖς = οὖσ-ως, Goth. dusō, A.S. ēare). Note also in unaccented syllable -u- from -ou-—dēnuō (dē novō):

In Gothic, as in Teutonic generally, o becoming a, or appears as du. It appears in Anglo-Saxon as āu. See above under āu. J is one of the varieties (ār, ī) of the i-unilant of ān—hlystan 'listen' (klon); cp. Sk. tru, Gk. xλ.ba, L. chrā (klul); Gk. xλ.ba, L. chrā (klul); Gk. xλ.ba (br. chrā)

For an example of ou in Old High German take scowoon (G. schauen) (A.S. scēawian, Gk. zo(F)in, (buo)oxi(F)o; 'priest,' L. caveō, Sk. karis 'wise').

δu: The two letters forming this diphthong probably did not very often occur in the same syllable in Indo-European. The Sk. ashtisi (I.E. aktisi) shows that the final diphthong in the word was long, cp. 1. activus (*rotivus). For example of δin Greek, take βaβε (orig, δigs, fis. fis.).

CHAPTER III.

SOUND RELATIONS IN INDO-EUROPEAN—SEMIVOWELS, SPIRANTS, CONSONANT-VOWELS, LIQUIDS, NASALS.

THE sound-correspondences to be treated of in this chapter are those that derive from the sounds of the parent speech represented by the symbols $\underline{i}, j, \underline{u}, v, s, z, r, l, m, n, r, l, m, \underline{u} :=$

i: Sk. yūyām, Gk. butīr, Goth. jus, A.S. iuih, (North. accus.), O.H.G. inwih (acc. plu.).

It is difficult sometimes, owing to the fact that the sounds have rou together in most languages, to distinguish manifestations of the semivowed f from manifestations of the spirant f unless Greek aid us, where initially, the latter appears as f, the former as I. If Greek lack a cognates, then we have to search among available cognates, for sound-relations, that will help to settle the question. For example, a comparison of Sk, yladi, grd plu, and tithd, and plu of et 'go,' proves that the r is by origin f. The coincident occurrence of stamps y the semivovuel. Again, the ablaut-relation between Sk. Infigure (trajes, strong grade), nom, plu, and Irishii (tritus, weak grade), loe, plu, reveals the semivocalic character of the y of the first form

1 appears initially (example above), between vowels, after consonants, before consonants (when preceded by a, c, and e-vowels), and finally (as second element of diphthongs).

Take as examples—Sk. [rdjras &c.—see above under el; Sk. drāds is sky, Gk. Kie. [djra. djras); Sk. cdda, Gk. Faik. Goth. sedit, A.S. sedi, O.H.E. see j, (upide); Sk. ll, Hom. rai &c.—see above under el.

aj, ej, oj, aj, ej, oj, originally pure diphthongs, gradually suffered change, generally in the direction of coalescence. The long varieties shortened the first element when before consonants.

y in Sanskrit was probably everywhere semivocalic.

In Greek initial was reached through an intermediate voiceless f. Between vowels, f dropped out, unless the previous vowel was u — bies (ôFijes), vµuśu (vµusju), çıλèu (pɨλɨju), διλέω (öλλɨju), but Lesh. çuis (bhujō).

į following postvocalic s and μ palatalised them out of existence, and then formed a diphthong with the preceding vowel—rogie into rouse=Hom. τοῦ (Sk. tisμα); sɨπ from τɨμπ (Sk. syām, weak grade—Greek has strong grade from the analogy of forms with strong ie-; L. sɨem, siös, siet (siēm), weak grade like Sanskrit—the i, proper to the plural optative, ultimately ousted the iċ, proper to the singular); κλαξίω into κλαιδω. The αιδ of the last word became ā in Attic before ε- i-, and α- sounds, giving κλαίω, κλάιω, κλάιω, κλαίωμεν, &c.; the ā then pushed its way into all persons, producing the double forms κλαίω and κλάω.

After n and r, a following i disappears, after causing compensation in the previous syllable — πτένω, Lesb. πτένω (κτενίω); φθείρω (Lesb. φθέρρω (φθερίω). Notice also βαίνω (βανίω), Leveniō (gunió-m-).

i following λ is assimilated— $\ddot{a}\lambda\lambda o \epsilon$ ($\dot{a}\lambda i o \epsilon$).

The combination p_i gives in Greek $\pi\tau$ — τ υπτω (τ υπiω); $\pi\tau$ υω ((σ) $\pi \underline{i}$ \bar{v}), Lith. spidu-ju, L. $spu\bar{o}$.

ki, ghi, kui, ghui give for result a sort of geminated spirantal sound which medially is sometimes approximately represented by -ττ, sometimes by -στ, but initially, always by στ. It used to be said that the f dentalised the guttural into τ, and that this letter then assimilated f ττ appears in Boeotian, Thessalian, and Attic, σσ in the other dialects; the latter representation is said to be the older.

Examples are ἤσσων ἤττων (ἡκίων), compare ἤκιστα, L. εξείιις 'otherwise,' perhaps equalling ἦσσων (ἡκιων) (the form sequius, said however to lack authority, would seem to point to a velar, εξείτιις – εξείτιις is called a comparative formation (compare diutius), with the ε dropped, as Quintius for Quinctius);

άσσω (angh-), compare άγχι; τίσσω, τίττα (peku-), compare L. coquō; il. άσσω il. άττω (lghu-), compare il. αχύς.

For this sound occurring initially, take as example Hom.

ghj when initial, results in χ²-χν̄ις (ghjes-), Sk. hyơs, L. heri, Goth. gistra-dagis, A.S. geostru (co=o-umlaut of c). O.H.G. gestaron (G. gestern).

tj dhj became se; this after consonants was reduced to e, and in other surroundings, though se remained in Homer, simplification also gave the same result; dialectically, however, the se appears as rr—desa, arra for ria (the 1-forms are due to the adoption of the acc. rn as a new stem in place of rn) neutre pluc of it. In the last word, the initial a is due to the frequent conjunction of this form with other plurals in a, from which by wrong division it abstracted the a, e.g., \$rmit raw was divided serio derest draw for many risk to the ghost-word source, also Sayce's explanation of also, as due to a reading of raspides/pant, as exerpize y also, so due to a reading of raspides/pant, as exerpize y also. Consult index, under new and nicknown, for similar results in English. Resuming examples of tj. dhy, we have rake for exerpize; please, Attle sies; (Sk. middfyna).

si also gives σσ and ττ—zασσύα, χαττύω for κατσζυίω, L. suö for sūö, Goth. siujan, A.S. sčotvan, O.H.G. siutvau (G. sāule, 'Ort des Schuhmachers') (Sk. syū-).

Note the different results in Greek of μίσους, μίσος (suffix -iω), and of σάτρος (suffix -ijω).

dj, gj, gwj give as result a sound that is represented by the letter ζ (Lesb. σi)—πζές 'on foot,' compare σίδη 'fetter'; ἄζομαι 'reverence,' compare άγως (igg.); iίζω 'wash,' compare ήστω with labialised yelar (neigy.).

Note the different results in Greek of jigo 'work' (reg.

ριζω (or Fραγίω), Goth. vadirkjan, O.H.G. zourchen (G. zoirken) (μης), with suffix -jō, compare Gk. ἔργω (ipδω - gorgiō), A.S. zoircan (μετς), and of löfω (suid.), L. sūdor, A.S. svoid, O.H.G. svoig (G. schweiss) (suoid-l.), with suffix -itō.

i appears in Latin initially as j—jecur (cp. Gk ἢπωρ); after a consonant it preserved consonantal force, only if said consonant had disappeared—fovis (Sk. dyāts), ātō (aghiō). If the consonant remained, the i had vocalic force—medius (Sk. mddhyas), ventō for veniō, socius (sokujos), compare sequer (seku-).

Between vowels <u>i</u> drops—aer- (aes, aeris) (Sk. áyas 'iron'), stō (stājō), moneō (moneṭō), audiō (audiṭō). An <u>i</u> has also dropped in spuō (spiu-), suō (Goth. siujan), herī (ghṭes-).

Allusion has been made to ai, ei, oi, āi, ēi, ōi, under these respective heads. The first element of the long varieties is shortened when a consonant follows.

In Teutonic, <u>i</u> and <u>j</u> have the same representation. For an example of <u>i</u> appearing medially in Gothic as <u>j</u>, take midjis (Sk. mådhyas), siujan (Gk. κασσύω 's titch,' L. suō siū-).

After a short vowel there is a noticeable representation of \underline{i} in Gothic, viz. -ddj-(Norse -ggj-,ggs)—iddja 'I went' (Sk. $dy\bar{n}n$), A.S. $\bar{c}ode$ (jia+de, pret. suff.); $twandj\bar{e}_i$, gen,, Norse tweggja, A.S. tweg(e)a, O.H.G. zweijo. In West Germanic, an i was generated, which formed a diphthong with the preceding vowel, or gave \bar{i} , if the preceding vowel was i.

A w occurs in place of an <u>i</u> in Anglo-Saxon and Old High German—A.S. sāwan, O.H.G. sāwan (sāan sāhan), saian (i for <u>i</u>), (Goth. saian, sējō); A.S. blōwan, O.H.G. bluojan, bluowan (Teut. blājanan —L. flās). It is supposed that after <u>i</u> had in part dropped out before guttural vowels, w was foisted in as glide. On the establishment of the types, interchange would ensue, and one or other type be generalised. This is Brugmann's explanation.

j. for which there was no special sign in the manuscripts of Anglo-Saxon and Old High German, was represented initially, especially before n, by i-A.S. hing (corns), O.H.G. hing. It is not known whether originally i or j appeared in this word. Aledially i is also found, but perhaps stands for ij.

In A.S. ār 'brass,' O.H.G. ār (Goth. aiz, Sk. dyas, 1. acs (ájes-), we have an example of the dropping of i. It is also dropped before i.

In Anglo-Saxon, palatal g is a representative of j-gif'it' (Goth. jahai); g is also a representation in the same language— cic_Xan 'call,' a-ja-verb $(ie, umlaut of <math>\delta a$) (gvoy-), Gk. $\beta \omega p_e$.

In Old High German, g with sound of English y in yet, also occurs as representative—gener (jener).

Original i can sometimes be traced by gemination—A.S. syllan 'give,' O.H.G. sellen (Goth. saljan); A.S. ecg 'edge' (L. aciës).

In Anglo-Saxon, the fact of umlaut argues the original presence of *i dēman* 'deem' (Goth. dēmjan).

With reference to Gothic sinjan (L. smi, Gk. suewise), it is conjectured, that in forms, where the j of a formative suffix followed hard on a previous j, the first was lost by dissimilation, even in the Indo-European period, but being preserved in another setting, might reassert itself even in conditions where it had originally gone under.

i before a consonant, and after long vowels, was dropped in the primitive language—compare Sk. rāpus plu, with Sk. rās sing., I. rās. j: Sk. jugám, Gk. Zvyés, L. jugum, Goth. juk, A.S. geoc (iucian 'to yoke'), O.H.G. joh (G. joch).

Gk. \(\zeta\) argues the spirant. The existence of the spirant can best be demonstrated when it occurs initially. It is

said, however, that zerrar may be attached to a root kej-.

Gk. Zuzie, it should be mentioned, had originally for initial

sound not j, but di (cp. dialectic form duyés), which fell together with j in primitive Greek.

It might be well to give another example of original j— Sh. yêsāmi 'bubble,' Gk. Çiu, A.S. gist 'yeast,' O.H.G. jesan 'ferment' (G. gāren) (jes-).

jean 'terment' (G. gåren) (189-).

Another proof of spirantal I or j is worth mentioning:

When y is spirantal in a Sanskrit werb, it still remains in reduplication, whereas, when the y is semivocalic in origin, a

weak-grade form of the verb is found, beginning with t, e.g., t appears in tydia, perf. of yet sacrifice' (Gk. dyne, diqueu), instead of yes. This change of y is by Sanskrit grammarians called sumpriserays (cp. below under y and y).

In Latin and Teutonic, as in Sanskrit, i and j fell together.

1. Sk. Suthuras. Sk. kruste I. sorer (succes) Goth

u: Sk. śvdśuras, Gk. izupic, L. socer (succer), Goth. swdihra, A.S. swēor (sweehor), O.H.G. swehur (G. schwäher)

(suékuro-). v: Sk. vásē 'clothe,' 1 sing. pres. ātm., Gk. ἔννῦμι, L.

vestio, Goth. wasjan 'clothe,' A.S. werian 'weat,' O.H.G. werian.

It is usually impossible to tell to which of the two sounds, semivowel or spirant, a sound under consideration has to be referred. If, as in the case of i, a alternates with the vowel n, we may be sure, that in the given case, its origin is semivocalic. For example in Sk. cintodis (keinaytis), 3 plu. pres., and Sk. ciauthd (Isinuts), 2 plu, pres. (Kuel-'set in rows'), v alternates with w, a fact which argues an original y. Moreover, and it will be remembered that this also held good in the case of j, if there subsist certain ablaut relations between certain sound-groups, and one of the correlates be of a vocalic nature, we are entitled to infer the presence of the semivowel. For example, A.S. swafts 'dream' (supmos, strong grade), B.L. zomusi (uppnose, strong grade), Gk. iorse (unpnos, weak grade, Greek has generalised the weak grade of certain cases) exhibit a correspondence that, in the circumstances, proves the presence of the semioweel.

In Sanskrit verbs reduplicating with var, e.g., vrdh, grow, pf. atm. ouvelh we pronounce for the spirant; in those reduplicating with w, e.g., vac 'speak,' pf. undeh we pronounce for the semirowel. Compare what was said above under h.

Initial u was lost in Sanskrit before u and ü—Sk. ūtoam 'caul' (L. vulva) (ulu-); Sk. ūryā, L. lāna (uln-), L. vellus (uln-).

In Greek, I.E. y appeared as F, which was, as a rule, vocalic and not spirantal in character, sometimes also as u and B—Æol. also (dFue), Attic δώ; 'dawn;' Æol.' βρέτων' orator.' The F remained up to historic times, and first disappeared in Ionic-Attic. The disappearance took place both medially (see below), and initially—Free (L. vetur). Sometimes, initially, y is represented by '—Āoze (L. ulcus (quilars, vecturs).)*

⁸ Mr. Darbishier refers this to a root beginning with s or sy, holding as he does that Fequilarly became 'in Greek. Certain obstinate rough breathings he refers to original v and not y, supporting his contention by facts drawn from Armenian, where, as he seems to make out, the semi-vowed and the spirant are still distinguishable.

In latin also, y drops initially before if followed by a constraint, unless that consonant be l (except l+c)—unda (yond-, t'oth, wath, A.S. wester (yod-); also before sonant l and r—lina (ep. wellus), rädis: (Goth, wathrs) (uff- and yrd)); but cerrār 'boon; (S. L. pays (years, yra-).

/ and r-lina (cp. vellus), radix (Goth. wahrts) (ufd- and urd)); but cerres 'boar,' Gk. apan (yers, yrs-). For examples in Sanskrit, Greek, and Latin, of w hetween vowels, take Sk. jīvás, Gk. Blos, L. vivus, Goth. kwirs, A.S. cwic, cwice (c developed before u(w), E. quick, whit(lear) (p. 96)), O.H.G. quec (G. keek) (guiyos); Sk. dvis, Gk. #(F)15. L. ovis, Goth, aucibi 'flock,' A.S. cowu 'ewe,' O.H.G. awi nom. plu. (G. auc 'nur noch mundartlich' Weigand), I.E. oui-; Sk, nápa, Gk, ivia (iv 11Fa 'nine in all'), L. novem, Goth. niun, A.S. nigon, O.H.G. niun (for niuun, A.S. g is a glide, I.E. neun); Gl. 165, 65 (atfos) poss. adj., L. sinis, O.L. sovos (seuos)-cp. tuus, O.L. topes; Gk. ve(F)6s, and denuo for de uorā: (jk. š. Goth. si(k), E. bu(sk) (sue), L. sé (suē); Ck. of(F)o; 'alone' (ojuos, strong grade of demonst., rt. i)-cp. Gk. chés 'one,' shá 'ace on dice,' L. unus (oinos); Gk. al(F) av. L. aerum, Goth. diws, A.S. awa dat., O.H.G. ewa 'long time '(Kluge says that A.S. aw 'law,' O.H.G. ewa 'marriage' G. ehe) are from aeguus, but aeguus (aeviguos) is perhaps connected with aevum); Sk. devás, Gk, 80c, L. divus (deivos), Norse Tyr. A.S. Tiw 'god of war' (E. Tuesday), O.H.G. Zio. Note the disappearance of u in Sk. dyam, Gk. Ziv. L. diem (diem, cp. nom. diens 'sky'). After a consonant the following may serve as examples:

Aiter a consonant the following may serve as examples:

—of ty: \$8i. actobras, Goth. fidwor (hwidtwor, for f see
Chapter IV.p. 104), 6k. rirraps; (krifups;), L. qualtur, A.S.
fönver, O.H.G. fior (hyekyer- kyekur, the second guttural

due to assimilation) (Kustuder, kustur, kusturo-); of du: Sk. dvis, Gk. šif, L. bis (cp. bėllam=duellum); L. bonus (dyones), compare Sk. dibus 'a mark of respect'; of ddu: Sk. ūrdivods, Gk. špēis, L. arduus (fdluges).

Note L. quartus (kwtnrtos), Gk. (σ)rράσιζα (kwtnr.). The lost consonant in τράσιζα would, being a velar, have appeared as τ, before τ. Compare for loss of initial letter, Sk. (k)tárvas 'fourth.'

For examples of py, bhy, take 1/2105, for 1/24-16 (cp. 1/24-16); bespecials, for bespecials (pbu); dubius for dubhyijos; -bō, -bam, for -bhuō -bhuām.

It is not a velar guttural that appears in equus (post-class, form owing to the analogy of equi—class, form ears or equus), but a palatal guttural followed by y. The root is I.E. ékuos. The cognates are St. étous, Gk. frees; france; (?), Goth. aithura, A.S. coh. The 'in frees represents the é that so frequently was prefixed in the sentence-life of the word—cp. Fr. fierre 'vy' for Phierre. The é of lewas (I.E. e) vis a stumbline-block.

au is thus represented—Sk. szódás, Gk. köle, L. szőzás,
A.S. szóde, O.H.G. szójé, (spädu-); Gk. (f)lé (speks), I.
szó, Goth. szólás, A.S. szoz, O.H.G. szó, (soks); Sk. zzószoL. szoz (spesör), Goth. szószár, A.S. szozatór (co due to
n-umlaut), O.H.G. szeszér (spesör-); Sk. szóz swent, Gk.
Ros, idose (spid-), L. szózó, A.S. szóz (spojd-).

Gk. F, ρF , λF were differently treated, in some dialects becoming n, ρ , $\lambda \lambda$ —in others, remaining as s, ρ , and λ , with compensation-lengthening in previous syllable. In Attic the F simply dropped.

Examples are Lesb. γόνα, Ion. γοῦνα, Att. γόνατα (γοι Fa);

Ion. 20ύρη, Dor. 2ώρα, Attic 2όρη (20ρFα); Hom. οὖλος, Att. δλος (όλFος), Sk. súrvas, L. sollus.

Enough has been said about y as second element of diphthong under au, eu, ou, &c. Before consonants, the first element of au, eu, ou, was shortened in Greek. These diphthongs then fell together with the corresponding shorts.

After a consonant, \underline{y} in Latin sometimes remains—arvuuu; sometimes interchanges with b—ferve δ and ferbe δ , hefuus, gilvus, and gilbus; sometimes is vocalised—teuuis (Sk. tanvi 'stretched'); after l'it is assimilated—vollus (Sk. silvus); it drops after f (from dhy), and in an unaccented syllable after d—fallo (dhyl, Gk. bōxpss 'troubled,' Goth. dwats 'dull, A.S. dol, O.H.G. toll (G. toll') (dhyol-) Wharton), dis'asunder' (Goth twis (standau) 'to depart from one').

Finally it is vocalised after loss of e—seu (sive). In Teutonic, g was still a vowel-consonant. This sound remained in Gothic, but in other dialects progressed towards a spirant. In this family, g is very constant, appearing in all positions. In Old High German, it was apt to disappear after consonants other than r, ζ , s.

Examples of u in the Teutonic languages have appeared

above. It will therefore only be necessary to mention one or two more of particular interest or significance.

Medially between u and u, y is lost in Goth. juggs (jurunges), A.S. geong and iung, O.H.G. jung (L. juveneus, juunkb).

Before a consonant in Gothic, as we saw above, w was written u-kwius from kwiu(a)z (L. vīrus—(gvīnos).

Parallel to the representation of $\cdot j$ - by $\cdot ddj$, we have y after short vowels represented by $\cdot gg_{T^*}$. (Norse $\cdot gg_{T^*}$, $\cdot g_{T^*}$). In West Germanie a u was generated which formed a diphthong with the preceding vowel, or gave \bar{u} if the preceding vowel was u—Goth. triggger

'true,' A.S. triewe (ie=io by i-umlaut), O.H.G. triuwi. In Teutonic, ny becomes nn, n=Goth. kiuns, i.S. cin(n), O.H.G. chinui (Gk. yios 'jaw,' l. genuinus 'grinder'); A.S. Kyune, O.H.G. dunui (Sk. tanks, L. teunis—tund.).

In A.S. cuman, -un- (= wi=Teut. we) appears as u-

cp. O.H.G. koman (queman) (Gk. βαίν», 1. renii—gvmió).
From A.S. μίτου (Goth. μίνω, see above), it appears that

g sometimes represents orig. u; and A.S. coh (L. equus, see above) shews that u, after becoming final, may be lost.

ya from ya, is, in A.S. geolo 'yellow,' O.H.G. gelo (gen. gelves, G. gelb), L. helvus, gilrus (ghvelnos) represented by o. Compare O.H.G. ero 'carth' (L. arvum).

8: Sk. svásň, L. soror (syesőr), Goth. swistar, A.S. sweostor, O.H.G. swester (G. schwester) (syesta-).

There is no cognate in Greek unless Schrader's suggestion anent *isss: be adopted, viz., *isss:= of reosts: 'sisters' children,' orig. 'sisters.' In the Teutonic cognates, a I is developed between s and r (see below).

s generally remains in Sanskrit, but passes into the cerebral sibilant sh, when immediately preceded by any vowel save δ , or when preceded by k or r, except the s be final or

followed by r-vishám (uisôm, cp. L. virus (uisôs)); snushá 'daughter-in-law' (I., nurus); parshnis 'heel,' Gk. wripva (cp. 7/7.15 and 2767.15), I. perna 'ham' (pernix 'swift'), Goth, fairena (s, and not s, to have been expected, the

accent being on first syllable), A.S. fiersen, fyrsn (ie, y = umlaut of ea the breaking of e), O.H.G fersana (G. ferse) (persna, -ni). Note also shash 'six' (I. sex). Before & (palatal sibilant) at the beginning of the next syllable, s becomes s-srásuras 'father-in-law' (Gk. inusis

(oFex-)). sk appears as ch (cch)-gáchāmi (gácchāmi) 'I go' (Gk. Βάσχω (βάσχ. 70ι)) (gymskó).

For the general history of the s sounds in the Classical

and Teutonic languages, it will be convenient to make the surrounding of the sound the principle of classification. Starting from examples with a vocalic neighbourhood, let

there then be set down examples of s in the neighbourhood of continuous consonants, followed by examples that exhibit s in the company of stops.

s before vowels passes into ' in Greek, but remains in Latin and Teutonic-Gk. Fromas, L. sequor, Goth. salkwan, A.S.

scon (for sechan), O.H.G. sehan (seky-); Gk. upak 'shrewmouse, I. sorex (Fr. souris); Gk. nu., I. semi-, Sk. sami-, A.S. sam- (E. sand-blind).

Sometimes' appears, if in the next syllable or the one after, an aspirate, either original or developed from s, is

met with-Gk. 'abu 'dry' from aihu, older abhu (cp. fut.

αύσω), and in other cases-είρω = iρίω 'join,' L. serö. In

ήμεις (Sk. asma-), the 'is probably due to the analogy of υμεις (Sk. yushma-), and εἰστόμειν (for ε΄(σ)ετόμειν) takes after εσομαι.

Between vowels, s disappears in Grêck, and generally passes into r in Latin—Gk. rives, L. generis, (Sk. jánasus—gen.), cp. Goth. kmi, A.S. cyn(n) (y=umlaut of Teut. n), C.H.G. cunni (gp.), and L. näscor (gp.); Gk. žec (Attic h), Sk. átem (émp). L. eram is supposed to represent an unaugmented éem, m should have given em in Latin, and the am will be owing to the analogy of the usual imperfect ending. Ann. There is no trace of augment in Latin. The general absence of augment is perhass due to the

generalisation of unaugmented types.

The following are additional examples of intervocalic s—

Gk. \$\phi_{\text{plan}}(Sk. \text{bhdrase}); Gk. \frac{\pi}{\text{abs}}\text{as} 'I knew' (Sk. \text{dvedi-}

sham, aor.); Gk. νι(σ)6ς 'daughter-in-law,' I. murus, (Sk. snushā, A.S. snoru, O.H.G. snora, snura (G. schnur) (snus-)); μείζω for μειζοα = μειζοα, cp. 1. mājōra for

māhjōsa.

Sometimes, however, intervocalic s is found in Greek—

update 'leek,' L. porrum (pfsom).

In Latin too, s is found—susurrus, a word of imitative

origin, asinus, nāsus, casa, caesariēs (for these last see account of Conway's Law, Chap. VII.).

s in causa caussa, is for ss—caussa 'cutting, legal decision' comes, according to Conway, from the participle of 'acuta', which became citág, on the analogy of incide. The s in finat 'spindle' stands also for ss—finus from fiddus, participle of fundă. quaeză is for guaes-să (or apply Conway's Law), haust for haus-să.

One more example of intervocalic s in Latin is $er\delta$, O.L. $es\delta$, subjunctive used as future, cp. Gk. $\tilde{s}\omega$ $\tilde{\omega}$.

Medial s may remain in Teutonic—A.S. masu (cp. L. nāris), or berome r (through s), if the vowel immediately preceding did not inwe the principal accent (see account of Verner's Law, Chap. VII.).

s before j and y has been already treated under j and y.

In Mineroa from Menesyā (cp. Gk. μωνισ-'sense, mind')
we have s appearing as r before n.

Something must now be said of s in conjunction with continuous consonants.

sr in Greek becomes ρρ, which, when initial, was reduced to ρ—Hom. iρρπ, ρ̃π (Sk. dsravat) (srey-), ρ̄νῆ (sroy-), ρ̄νῶν (sru-), ρ̄νρ̄ν̄ν (srobb-, cp. L. sorρ̄ν̄ν̄ (spbh-)).

In Latin, initial or became thr, then fr; medial or became hr—frigus - srigus (GE, Frys); fröga 'strawberries' = rrigus (GE, Frys); fröga 'strawberries' = rrigus (GE, Frys); fröga 'strawberries' = rrigus 'sister's son'; corrbrum - ceresrom (keres-), cp. Gk. xápā for zapsu (kres-); finnerius - from from from from site is: muthrum = memsrom, cp. Goth. mim. 'flesh'; tenbrae (Sk. timisrā, O.H.G. demerunça (G. dämmerung), cp. O.H.G. dinstar, finstar (G. finster). Two stems mixed produced tenebrae, vix., tenusā and temera. The former became tenzā, and its u was introduced into the latter. This is Brugmann's explanation of the n in tenebrae, Kluge says that dissimilation from the following labial ô produced n, Wharton suggests a popular connexion with teneš.

In Teutonic, sr initial, or medial (before the date of Verner's Law), became str—Goth. swistar, &c.; A.S. stream, O.H.G. stroum (Gk. psf—(srou-).

The combination rs has been already referred to under rs in Greek becomes λλ which initially passes into λ, and sometimes medially, with compensation—λέγω (cases (alegu-), cp. langues (aleagu-), A.S. slace and O.H.G. slach (alegu-); Gh. χείλων and χ/λων, Lesb. χέλλων (Sk. sahdsra) (glashe). ghealtio-).

In Latin s disappears before 1—langueō (see above), prētum "wine-press" for prestum, atā for axīda (ep. axīda (armpit, A.S. caxi 'shoulder,' O.H.G. ahsala (G. achsal)), vēlum for vextom (ochā), saita for santstā (scandā), cultus for oceslīnā (without compensation in unaccented syllable). Idents is for stloras, fis for stliz, līčn 'spleen' for splīju (Gk. exist).

sl remains in Teutonic.

The combination & has been referred to under A

s medial disappears in Greek before w, with compensation—Attic that, Leek, lauu (inqu): ¿¿na 'leaven' (¿yana), L. jiis 'broth', cp. St., yīshās. Sometimes, however, ly yorm-association, the s is brought back—thus, for induces ina's for regular shau, and hapherou induces inaphapus beside regular shau.

dannes is for of arquires (p. 122) (spad.), cp. dabdas (spand.)
and theyau (spad.); hough for theyau (cp. 124).

σ remains in σμιρδαλέως 'terrible,' A.S... smoortan (Ε. smart), O.H.G. smercan (G. schmerzen) (smerd-), cp. L. mordeō (smpd-), but drops in μιιδιάω, after assimilation, cp. φιλωμμιδός.

In Latin s drops before m*—mirus, cp. Sk. smi 'smile,'
E. smile, smirk; primus for primus; dimoved for dismoved,
camena for casmena, mitté for opsmitté—the last-two without
compensation in an unaccented syllable.

* Conway says that during the period of rhotacism s before nasals and after an accented syllable became r in Latin—carmen, verna, diurnus.

subtêmen is for subtexmen, semenstris, for sexmenstris. su, as appears from cognates given above, remains in Teutonic. It drops however in Goth, im 'am,' Gk, slue (land).

A.S. čum is said to be the result of contamination with beom. For example of ms take in Greek issua, Lesh. inqua (for in atin, sumpsi with intrusive p-unless this is a new formation, for ms probably became ns; in Teutonic, Goth, ams (Sk. ámsas (6msos)-cn. I., umerus (6mesos) and

Gk. aus; (omsos).) su in Greek passes into w-ibrares 'well spun' ((d)me).

Initially, this was simplified to -- rv(o)6; (Sk. snushá). w remains in some dialects, but is in others simplified. with compensation-Ion. cassés, Lesb. passés (for paferos); Tong for Toon. Ionic show 'dress' exhibits this simplification and compensation, but & was reintroduced from forms

with that letter, viz., islines, &c., and the influs that was got after assimilation of the s became permanent. s before u disappears in Latin-nurus (Sk. smishā): satin

for salisne; viden for videsne, with shortening of vowel; dinumero for disnumero : perna cham' (perana, see above) : annus for asnos (ann-), cp. Goth. asans 'harvest' (ason-).

lina is for louxna : seni for sexui, penna for petsna (pet-'fly'); cernuus, 'headlong' for cersuus, cp. cerebrum for ecresrom; alnus 'alder' for alsnus, A.S. atr, O.H.G. glira

and erila (G. erle). For sn in Teutonic, take Goth, asneis 'day-labourer,' A.S. esne, O.H.G. esni (Teut. ásnija-, with accent on first

syllable-cp. Goth. asans 'harvest'); but forms also occur that must have had the first syllable unaccented, judging from the operation of Verner's Law-O.H.G. arn, gen.

arni 'harvest' (M.H.G. erne, G. ernte), arnon 'reap,' A.S.

carnino veum ' (Teut. aznājam). Also, accentless on root, A.S. lovnino 'learn,' O.H.G. lirnin, lernin (Teut. liznōjam—cp. Goth. dii.' 1 know, 'pret.-pres. with accent on root-syllahle); and O.H.G. hirni (G. hirn), from hirzni hirri (Teut. litzniji, l. errebrum, Scotch harns. Compare also, will labial, Goth. hwedrawi 's bull.'

The combination *ms*, followed by a consonant, has been already noticed under *m*.

For an example in Greek of ns, followed by a vowel, take image. Lesh, image (for image).

criesω 'winnow' is said to be for crnsiω, L. pinsū (pins, and pis.).

ns remains in Latin—mēnsis. ns occurs frequently enough in Teutonic, and often where one would expect no.

ss in Greek hecomes s—īrsos appears as īrsos, even in Homer, cp. δύστριος for δυς + στριες.

ss remains in Latin after short vowels, but is reduced to single s after long vowels—gesti, gressus, cassus 'empty' (cadtus from cado), but misi, hard, fixes (see above), ss probably occurred in primitive Teutonic, but afterwards got reduced to s. There are no sure examples.

Before tenues, s usually remains everywhere.

For s lost in such a surrounding take as example Gk.

ze(F)/ω 'perceive' ((ἀ)zeω), L. αιτοδ, Goth. (αερικατου 'prudent,' A.S. sciencian 'show' (ἐκθου, cp. δυσευί/F)ες 'sacrificing prints'); L. βαντου 'sparing,' cp. Gk. επαριές, λ.S. ερνευ 'sparing' (αραυ-).

sabnln m 'sand' is for psablom (psabh-), cp. $\psi \bar{s} r \circ s$ 'pebble' (psabh-).

In the combination ks, the letters sometimes interchange

places— L. asria 'axe,' cp. Gk. àğim, Goth. akwisi, A.S. eax; L. riscum 'mistletoe,' cp. Gk. ig6.

s in super, Sc., is said to be a reduction of ks, cp. igbπsρθs 'from above.'

sh has been transposed in gipes, cp. Lesb. exipes.

studeo is for pstudeo (pstud-), cp. Gk. στεύδω 'hasten' (psteud-): sternuo 'sneeze' is for psternuo (pstern.), cp. Gk.

Trasiquas (pstrp.).

Examples of final s are common everywhere. Final s in Teutonic was subject to the action of Yerner's Law. The swhich the operation of this law produced, passed into s in Gothic, and shared the lot of the s that had remained unchanged. But the regular appearance of original final s, as s, when a suffix is attached—juste 'y who '(Ins' ye's), known' every' (knows who')—would lead one to suppose that before its present is present to the demanding unusual that the fore its present is to be defined to suppose

kneeash 'every' (knoss 'who')—would lead one to suppose that before its passage to s, s had generally usurped the place of final s. This opinion is supported by the fact that in the case of an s which had become final at a later date, s remains—weash 'and there was' (nous 'it was.')

Final s was in Norse levelled:under s, the latter appearing as r.

In West Germanic, final s—which had made encroach-

ments on the territory of final s-was dropped, but final s was retained. In Old High German, the s dominated the nominatives plural of a-stems, but in Anglo-Saxon, s reasserted itself, and was generalised—O.H.G. taga 'days,' A.S. daras.

When r appears for z-O.H.G. ir, er (Goth. is); O.H.G. wir (Goth. weis); O.H.G. zar, zur, zer (Goth. tuz-)—this is doubtless due to facts in sentence phonetics.

In all European languages, the combination of original

media aspirata + s, has the same representation as original tenuis + s.

z: This sound probably only appeared before mediaeand aspirated mediae. Owing to the operation of variouschanges, this consonant hardly survives in proprite persona in the languages under consideration.

Gk. effinant quench' is said to represent zgve, the weak grade of segve, seen in L. sguts' slow.' Gk. feb, 'be' is for isdhi (sdhi), with prothetic vowel, induced by sibilant. feb 'know' is for pidchi' (ngld-).

In Gk. µ10865, Goth. mizdo 'reward,' A.S. meord (W.S. mēd (E. meed)), O.H.G. mēta, mieta, miata (G. miethe 'pay'), the originals were mizdhé. mizdhé.

Gk. zboto 'hole,' L. custos, Goth. huzd 'hoard,' A.S. hord are to be referred to huzdh (koudh 'hide,' cp. Gk. zbbto, A.S. hydan (with i-umlaut of &)).

The original of nīdus was nīzdos; of sīdō; sīzdō; of mergus 'gull' '('diver'), mezguo; of īdem, īzdem; of hordeum, ghrvadējom, cp. A.S. gerst, O.H.G. gersta 'barley' (gherad-); of nīdōis, &c., nosbīs, with bib- suffix.

hasta (Goth. gasat. 'goad,' A.S. gierd (ie = i-umlaut of ea, the breaking of a) (E. yard), O.H.G. gerla (G. gerle)) is from ghasatha. E. goad (A.S. god (ghaţtó-) is cognate with Sk. hi 'drive on.' and Gk. yahe 'shepherd's staff.'

r: Sk. rudhirds (rudhr-) Gk. ipobpis, L. ruber (rudhr-, L. russus (rudhto-)), Goth. rdups, A.S. rēad, O.H.G. rēr (roudh-, cp. with same root, L. rūfus).

There were at least two liquids in Indo-European—r and & Sanskrit does not always corroborate European (or-Armenian) in its representation of these sounds, for, while Sk. r usually answers to European r, the latter is sometimes represented in Sanskrit by L. Sometimes both r and a later L appear. European L is in Sanskrit mostly represented by r, but sometimes by L, or by r, and later by L. The L, however, that represents European L is a much more frequent sound than the L that corresponds to European r.

So far as frequent occurrence is concerned, r in Sanskrit wins easily. There is hardly a root containing I, that does not also show r, and it was only in the later periods of the language that I asserted its individuality.

r had in Sanskrit a cerebral pronunciation. A following dental becomes cerebral, and r itself vanishes—kdtas 'wickerwork' (Rovert-), cp. Glr. zdgrea2.hz, 'banket,' Goth. hadrat 'door,' A.S. hyrdel 'hurdle' (r=k-mlaut), O.H.G. hurt (f. härd) 'wickerwork' (Kurk-), and I. ordiët flusti-).

In Greek, initial p sometimes suffers prothesis—ipubple
(L. ruber).

Occasionally, to satisfy the desire for dissimilation, the one liquid takes the place of the other—μορμολ.brτομαι 'frighten' and μόρμορος 'fear.'

This may be process is common in Latin—averuleus and caelum, (exempl) aris and (aequ) alis, peregrinus and Vulgar Latin pelegrinus (O.F. pelegrin, F. pelerin (E. pilgrin)).

Notice the following assimilations in Latin-stella for sterla (I. sterno), paulius for paurios (Gk. σαῦρες).

In the same language, riri sometimes result in er—hibernus (hibriums himrinus), cp. Gk. zguapole; incertus for incritos (cp. Gk. ängres); seerné for sécriné (even simple cerné with accented syllable shews the er; got presumably from the cpds.); tree (tris, cp. tris).

rs appears as rr, and before t, as s, with compensation porrum (Gk. spéars—pfsom); ferre for ferse; far farris (Goth. barizeins 'of barley,' A.S. bre-bhare); föstiginm, for färstigyinm (bhřatí-), cp. Sk. bhrahtis 'point,' A.S. byrst 'bristle' (nr into yr, by i-umlaut) (bhratí-).

Unoriginal rs remains, and interchanges with ss—dorsum dossum (dortum, dt+). Compare Dosseurs 'the hunch-back of the Atellan farces'; but this word is now said to be of Semitic origin, and to mean 'bon vivant.'

rs remained in Greek, but later became pp—bupóss and eapóss. Goth. gadadirsau, A.S. durran, O.H.G. turrau (dhra-); ripoquas 'dry up' (tera-); Sk. t/shyāmi 'I thinst' I. turrau (tera-) (sch. hajinti. A.S. Sur/u shoush inmlaut)

torreo (torseo), Goth. paárstei, A.S. vyrst (y through i-umlaut), O.H.G. durst (tps-).

rs sometimes becomes rr in Teutonic (see previous sentence)—O.H.G. irrōn (G. irren), (L. errare for ersare, Goth. airzian 'mislead').

For the r in Teutonic, that through intermediate s came to represent I.E. s, see the Chapter on Grimm's Law.

Note cancer (= career, by dissimilation) and zapzios.

r disappears before (s)n in cēna (caesna) = caersna, cp. sili-

cernium 'funcral feast' (sedoù+); after st in praestigine (by dissimilation) 'tricks' (prae, strīga 'witch'); before se in piscō (port(psō), Sk. predimi 't l ask', O.H.G. fornōn (G. fornchen) (pṛkak-), cp. L. precor, Goth. frailman, A.S. friguan (grak), and L. precor (grok-, Gk. beopieus=beoparies); and before st in tostus (tornius)

In the A.S. rifeling 'a sort of shoe or sandal' (Norse hriftingr, L. crepida 'sandal' (krep-), Gk. xenefs 'half-boot' krep-), we have hr represented by r.

Note the disappearance of r in specan (for spream). 'speak.'

In Anglo-Saxon, ir passes into il, sr into ss, in sella 'better' for selra, læssa 'less' for læsra. Sk. lih 'lick,' Gk. λαίχω, L. lingö, Goth. (bi)laigöu,
 A.S. litcian (α=53=5n=gin (with accent following), see
 Paul & Kluge's Law, Chap. VII.) O.H.G. lecchon (G. lechen)

(ligh-, leigh-, loigh-, lingh-).

In Greek, initial 2 sometimes suffers prothesis—haspi; 'light,' ibaz/ci, 'small,' Sk. laghdi, 'light,' A.S. lungre 'quickly', O.H.G. lunger 'quick,' (lughu- and lughtref), cp. L. lexir (lughu-), and Goth leihti, A.S. leiht (ee, breaking of i, shortened from i) (Teut. lihla, compens, lengthening, from lenghu-).

Before τ and θ, λ in Doric became --cp. the φίντατος and ξιέν of Theocritus.

λ: with preceding short vowel results in λλ, with later compensatory lengthening—βελλιται (Lesb. βελλιται) = γλιλιται (gylno-), δλ.λξιμι = δλοξμι.

In Latin It becomes by assimilation II—collii = colnis

(cp. Gl. κολωνές (Κυσίδια) unless it represents έω, when it remains—ñiλus (Gk. άλιλυ (δl(e)n.), cp. Goth. alcins ('verschrichen für alina' Kluge). A.S. ξω' 'ell' (E. alleu) (ε from a (orig. ε) by έ-umlaut), O.H.G. ξlin(α) (G. alle).

nl gives same result—homnlins for homonios.

For a like assimilation in Teutonic, compare the Gothic and Anglo-Saxon cognates of collis—Goth. halins 'rock,'

and Anglo-Saxon cognates of collis—Goth. hallns 'rock,' A.S. heall (cp. A.S. hyll (y=f-umlaut of ea) (kwoln-).

In Latin, Is also became ll—collum = colsum (A.S. heals), wells for oulse.

չ, remains in Greek—rɨλոս 'boundary-furrow' (Sk. kārshāmi 'I furrow, plough,' (kwels-).

kdrshāmi 'I furrow, plough,' (kwels-).

m: Sk. mádhyas, Gk. µi(s)os (-dhi-, see under i), L.

medius, Goth. midjis, A.S. midd, O.H.G. mitti (medhios).

In the parent speech there were as many nasals as there were classes of explosives—labial, dental, palatal, and velar nasals.

For these four nasals there were separate characters in Sanskrit, not to mention an extra character for a cerebral nasal. In English the character of a nasal is still determined by its surrounding, although only two characters are made use of.

Final m becomes s in Greek (and in Teutonic, conserved when followed by suffix, dropped otherwise)—Gk. rts, Goth. pana, A.S. Sone, O.H.G. den (with diff. ablaut) (Sk. tám (tom)): Goth. rentf (Teut. nut/an).

Note also a later change of m into n—O.H.G. dat. plu. lagun (from lagun), A.S. dagum (later dagon); O.H.G. t plu. geban 'we give' (from geban, cp. Goth. giban).

'mt is said to have become or in Hom. yinto 'he grasped,'

In Latin, m became n before t-contrā (cum); before d-cundam (cum), perudiā 'day after to-morrow' (cp. Sk. pdras 'yonder': assume a loc persuni (Sk. pdrasmin), whence parem, paren). Analogy however produced many exceptions—errunalmen and quamdin after the analogy of verm and quam.

This change also takes place in Teutonic-Goth. hund, A.S. hund, O.H.G. hunt (see under m) (kmtóm).

In Greek, $\mu\beta\rho$, $\mu\beta\lambda$, $\eta\delta\rho$, after the generation of β and δ , the nasal, when initial drops— $\beta\rho\sigma\nuic$ ($\delta\mu\beta\rho\sigma\nu\rho$) Sk. mdrtas, mrtis (mdros and mrtos, see under r); $\beta\lambda\omega\sigma\nu\omega$ 'come' ($\omega k\mu\beta\lambda\omega\kappa\kappa\sigma$, $\delta\mu\omega\lambda\sigma\nu$ ($m\dot{k}$); $\delta\rho\sigma\nu\dot{k}$ (probable substitute in cortain cases for $d\sigma\rho\rho\sigma\dot{k}$ $m\dot{k}$).

In Latin and Greek, mf becomes nf—veniō, βαίνω (gwmiō).

In this combination, gemination appears in Teutonic—

A.S. fremmian 'further,' O.H.G. frummian, cp. O.H.G. frum 'fit' (G. fromm).

m is lost in nūncupō (nōmencupō), in sēsgul- (sēmissi-+-que),

in forceps (formiceps, 'quod his, forma, id est calida, capiuntur' Festus).

Phunhum 'lead' is from mlümbom. cp. Gk. μέλνβδος.

Phonbum 'lead' is from mlümbom, cp. Gk. μόλυβδος, μόλιβες.

n: Sk. návas, Gk. níse, L. novus (néuos), Sk. návyas
Goth. ninjis, A.S. nčove, O.H.G. ninvi (G. nen) (néujos).

In Greek (and Gothie), guttural n is written g—žyyu,

In Greek (and Gothic), guttural n is written g—ãyza, Goth. (ga)acgrujan 'distress greatly' (L. angō).

› drops before s followed by a consonant without compensatory lengthening—mercie, 'embroidered' for unerse, from unrie, χαριέπινες for χαριξεπιστρες, 'Abγάζε for 'Αδγιαι-όε, δισσύτες (διες, I.E. dems 'of a house,' rt. dem-'huild').

n; final, in Greek, only remains in Cretan and Argive. Elsewhere the v became sonant, and formed with the preceding short vowel a long nasal vowel. This afterwards lost its

nasality—Doric ras, Ionic-Attic rass, (Cretan and Argive rass).

For rs followed by a vowel, see under s.

In final -us, and in -us, the n drops in Latin with compossitors, longthening—service for cons (Coth, cost), 4 then

pensatory lengthening—(equ) of for -ons (Goth. -ans). pilum for piuslom, ilico for in(s)loco.

By the bye, it is said that the combination of long wovel the fact the useal in Indo-European. Compare the fact

+us dropt the nasal in Indo-European. Compare the ās and ās of the following two ā stems—Sk. dśvās 'mares,' Goth. gibās 'gifts.'

In viciui for vicent-ni- (nikmt-), n has dropped with compensation, in vicen (ueikmti), nt has become s, with o for a, from the -xerra of the other numerals. Note $e\bar{e}$ usus for eeusus, and eufr \bar{e} ctus 'winding' (Oscan eumfr- (L. eumb-) and eug \bar{e}). Perhaps the er of eumfr- (eumfr-) is due to the analogy of prepositions in er, like euter.

In Teutonic, n disappears before h, and the preceding vowel is lengthened—Goth. pāhla, A.S. vāhle, O.H.G. dāhla (G. dachle) (O.L. longēre 'know').

Combinations with n in Teutonic, as noticed above in the case of ln, often result in genination of the previous consonant, e.g., kk = LE, kn, gn, ghn (palatals and velars), with accent on following rowel; ln = LE, ln, dn, dhn, with accent on following rowel; ph = LE, pn, hn, hhn, with accent on following rowel (see statement of Paul and Kluge's Law in Chapter on Grimm's Law).

γ: Sk. mṛtis 'death,' Gk. βρετές 'mortal,' L. mors mortis,
Goth. maūriyr, A.S. morš, O.H.G. mord (G. mord) (mṛt-).

Before i_j and, with r as intervening glide, before vowels, r is represented in Sanskrit by ur ir, in Greek by a_i , in Latin by a_r , and in Teutonic by ur, before other sounds (explosives, spirants, nasals, u) and finally, r is represented in Sanskrit by the r vowel, in Greek by pa a_r , in Latin by a_r , and in Teutonic by ru ur.

The ρ e of $\beta \rho \sigma v \dot{\phi}_{\sigma}$ is due to the mixing of a form having $-\rho - (r)$. The ρ in A.S. $m \sigma v \dot{\phi}_{\sigma}$ and O.H.G. $m \rho \sigma \dot{\phi}_{\sigma}$ is caused by what is sometimes called σ -umlant (see Chap. V.).

For general examples of r, take Gk. zwipe for zwipe. O.L. horior (hortor is from "hortus = zwris's 'wished for'); Sk. gurds, Gk. Bayis, Goth. hadrus (gertüh), L. gravis for growis (geyou), Cp. avis for ovis (Gk. słuńce - bieus; L. autumō (avitumō) 'sny,' Gk. służu (if-nau) 'think', (augural terms)); Sk. dires, Gk. nápā for napseš (kres.), cp. L. arrebrum (keres-); Sk. hṛd, Gk. καρδια εραδίη, L. cor arrdis (kṛd-), cp. Goth. hair tō, A.S. heorte (co = brenking of c), O.H.G. herza (G. herz) (kerd-); Gk. þɨξω (reg. þaζω for Fραγίω), Goth. ivaáir kjan, O.H.G. zonrehen (wṛg-) (see above, under ½); Goth. tradan 'tread,' cp. A.S. tredan, O.H.G. tretan (G. treten); Goth. brō]rnm, dat. plu. of brō]ra, cp. with Sk. loc. plu. bhrāṭṣhn ; L. querus (querquus quarquus) 'oak,' A.S. furh-, O.H.G. forha (the o due to following a) (G. fōlrre) (kuṛku-)—tree-names are sometimes confused, cp. L. fāgns 'beech' and Gk. φηγός 'oak,' L. frāxims 'ash' and A.S. beoræ (co = breaking of c) 'birch' (bh̄gs, bherg-); Gk. ἦταρ (jēkuṣ-), L. fecur (-ar) (jekuṣ-), Sk. ydkrt (jekuṣ-).

Note $\delta \delta \theta u \rho_i$ like $\bar{\delta} \pi u \rho_i$ with suffix t. The Sanskrit cognate is $\hbar d h a r$. The suffix here cannot represent an original t. There is some difficulty with the termination of L. $\bar{n} b e r$. The Teutonic cognates are A.S. $\bar{n} d e r$, O.H.G. $\bar{n} t a r$ (G. euter).

Sometimes or appears as ur in Latin (o before r+consonant fluctuates between o and u)—ursns for orcsos (Sk. f/kshas, Gk. u/g/kthos)).

ur appears in Latin initially as ver, vor, and ur (vur)—
verro (and vorro) 'sweep' (ups.), cp. Gk. ἀσδειροι 'it
swept away' (upss.); urgeo urgueo for yurgueo (upgu.), cp.
Gk. i(F)pryo, L. vergo (uprgu.).

nr appears as ru in trua 'handle' (tur-), cp. Gk. τορδιη 'ladle' (tuor-), A.S. δινιτιί (tuer-) 'churn-handle.'

For kur, confer querens above.

Initial $g^{u}r$ appears as gur (gor), in gurges (guge-), and as vor in $vor\bar{o}$ (guge-), cp. Gk. $\beta op\bar{a}i$, $\beta i\beta \rho \omega \sigma x\omega$, Sk. girnis 'a swallowing' ($gu\bar{g}$ -).

The appearance of ur or ir in Sanskrit, was doubtless

conditioned by the character of the neighbouring sounds. A labial neighbourhood would favour the appearance of ur. ap appears in Greek before vowels and consonants, a before consonants, while initially, a laways preceded A as in \$exers. Form-association sometimes deter-

sonants, ρa before consonants, while initially, α always precoded ρ , as in ρ_{EFF} . Form-association sometimes determined the use of $\alpha \rho$ and $\rho \alpha$ in Greek, and of ur or ru (urprobably original) in Teutonic. The u of Teutonic is in Anglo-Saxon and Old High

German subject to the usual umbuts—A.S. ford (or for ur, by α-umbut), O.H.G. furri, L. fortus (nytu-); A.S. cyrnet (yr for ur, by ε-umbaut), Goth. kathru (gyno-), L. grāiunu (ξ-). ‡: Sk. trutts, L. arnus, Goth. arns, Δ.S. carn (en = breaking of a) (fmda).

Everything is not yet clear about the representation of the long liquid sonants in general.

Thus much may be said of \bar{r} —in Sanskrit, it is represented by $\bar{r}r$ $\bar{u}r$; in Greek, by $\omega_{\bar{r}}$, $\omega_{\bar{r}}$; in Latin, by $\omega_{\bar{r}}$; and in Teutonic, by $\omega_{\bar{r}}$; in Latin, by $\omega_{\bar{r}}$; and in Teutonic, by $\omega_{\bar{r}}$.

As examples, take Sk. ūrdhvás 'upright,' Gk. ὁρθός, L. arduus (fdhuós); Sk. sfirnás 'spread,' Gk. στρωτός, L. sfrātus.
In Gk. ῦδωρ, the ωρ is said to be for f.

Gk. ωρ, L. ar were doubtless shortened from ωρ and ar, on some such principle as that which gives us L. veutus from

some such principle as that which gives us L. ventus from (uent-), see Chapter V., page 112.

1: Sk. pipruds 'we fill' Gk. (iµ) atalaus, L. polleō (polneō), Goth. fulls, A.S. fyllan (y by i-umlaut), O.H.G.

fullen (G. fullen).

"", compared with r, has in similar circumstances similar representations. In Sanskrit we have which we add the ri

i, compared win τ, has in similar circumstances similar representations. In Sanskrit we have ul (il), ur, and the τi (il) vowel, in Greek ωλ and λω, in Latin ωl, in Teutonic ul and lu (ull probably original). Take for additional example Sk. tul 'lift,' Gk. τάλωντον,
L. tolerō, Goth. | pulan 'thole,' A.S. δolian, O.H.G. thulten
(G. dulden) (t]!-), cp. Gk. τόλμα (--).

In Latin, ! also appears as ul (o before l + consonant, (except l!) passed into u)—tulī; gula 'throat' (gul-, or gl), A.S. cole (co = o-unlaut of e), O.H.G. chela (G. kehle) (guel-, or gel-); sulcas 'furrow,' A.S. sulh 'plough' (slkos), Gk. & Axes (solkos).

<u>u</u>f appears in Greek as λν, in Latin as lu—G. λυνος, L.
lupus (dialectic for luquus), Sk. vifkas, Goth. vulfs, A.S.
vulf, O.H.G. vulf (ulkuos), cp. Gk. ἐλκω 'drag' (uelku-):

The *u* of Teutonic is in Anglo-Saxon and Old High German subject to the usual umlauts—A.S. holt (of for *ul* by a-umlaut), O.H.G. holz, Gk. ελάδος 'branch' (kldó-).

Ţ: Sk. ûrŋā 'wool,' L. lāna; Sk. dīrglus 'long,' Gk. δολιχός, L. largus (lalgus, dalgus, r due to dissimilation); Sk. ūrmis, 'wave,' A.S. wielm wylm; Gk. χλωρός 'pale,'L. flāvus.

In A.S. wielm wylm, the ie and y are i-umlauts of ea, the breaking of original a. The Teut. type is ualmiz.

From the above examples, it appears that l was represented in Sanskrit by lr $\bar{u}r$, in Greek by $o\lambda$ $\lambda\omega$, in Latin by (al) $l\bar{a}$, and in Teutonic by al.

m: Sk. śatám, G. izaróv (for άzαróv, ά=sm, cf. L. semel (sem)—cp. άτερος for spiteros (ἔτερος gets its ε from the analogy of the oblique cases of είς), L. centum, Goth. hund (see under m), A.S. hund, O.H.G. hund (G. hundert, for second portion of this and of E. hundred cp. Goth. ralȳan 'count') (I.E. (d)kmtóm).

n: Sk. saptá, Gk. ἐατά, L. septem (m got from the ordinal) (I.E. septή), Goth. sibun, A.S. seofon (eo due to u-

umlaut), O.H.G. sibun (I.E. sepn), but perhaps m is here the original sound. Brugmann chooses the latter.

In the parent speech, as in the case of the nasal consonants, there were as many nasal sonants as classes of explosives—labial, dental, palatal, and relar.

In unaccented syllables before j_i in syllables with principal accent before consonants, and, with intervening m and m as glides, before vowels, m u are represented in Sanskrit by am an, in Greek by an, in Latin by an, an, and in Teutonic by nn nn; before other sounds (explosives, spirants, nasals, liquids), and finally, they are represented in Sanskrit by a_i in Greek by a_i , in Latin by an an and in Teutonic by nn, nn.

ilquids), and finally, they are represented in Sanskrit by a, in Greek by a, in Latin by em en, and in Teutonic by nm, nn.

For examples take Sk. dánta; L. den; Goth. tunḥus (dɪph.), cp. Gk. δδων, A.S. δδί (compens. lengthening for loss of δ), O.H.G. eand (G. eanh) (dont.); Sk. tantā, Gk. τανίγλωσες 'long longued,' L. tennīs, A.S. δγιαε (the y due to 'numlaut), O.H.G. danni (tunha.); O.L. hendî (alet homê (ghomê(n)), Goth. gmma, A.S. guma (u for West Germanic a, before nasal), K. (δρτάβχ(γ)ουπ, O.H.G. γουπο (α-α-umlaut) (ghumb(n)); Gk. βαίνα, L. τενιδί (gumpió), co.D. Goth. λεούπαιη, A.S. αππαι (ανόπαιη), O.H.G. quemen (guemn); Sk. απ(μαθτά) 'waterless' Gk. δι(υδρες) (μπ.) and Sk. α/μάθ. (δκ. δίσυν) (γ.)—Latin and Teutonic have the same form (L. in, Teut. nn) for both prefixes.

Note &seen.*fs 'helper' (e== &t') (sm-, so&* (cp. L. sequer)). There is a new explanation of milia which discloses sw-, vix., miha = sm(h)filia (i=1.E. sonant -2), cp. Sk. sa&sram, both =' one thousand,' whereas ¿Ph. a is simply 'thousand' (Amer. Jour. Phil., vol. sili. 2, p. 227).

Just as in the combination e+nasal, e passed into i in Latin, so em (m) appears also as im-sim(plex), sin(guli),

sim(ul), Gk. $\ddot{a}(\pi u \xi)$, $\ddot{a}(\mu a)$, $\dot{a}(\pi \lambda \nu \tilde{\nu} \xi)$, Goth. sums 'some,' A.S. sum, O.H.G. sum (sm-).

So en (v), as in lingua (for dingua), Goth. tuggō, A.S. tunge, O.H.G. sunga (G. sunge) (dnghuā). v appears as ī in īgnīs, Sk. agnīs (ngunīs).

The developed u of the Teutonic representation is subject to the same changes as natural u—A.S. syun 'sin' (yu for vun, by 'umlaut), O.H.G. sunta and sundia (sntiā), cp. L. sons sondis 'guilty' (sonti-).

m : Sk. ágāta, Gk. εβητε (Dor. ā) (é gumté).

The above cognates embody all that is definitely known about the representation of the long sonant nasals, viz. :—In Sanskrit, n and m are represented by \bar{a} , in Greek, between consonants, by \bar{a} , \bar{a} initial being represented by m. (Dor. n). In Latin, \bar{a} is represented by n and n, which correspond to GK. \bar{a} and n.

It will be useful here, to notice some formations in which the nasal sonants appear. A nasal sonant is seen in the personal ending of the 3d plu. pres.—Sk. sánti, Gk. (Ion.) tãar for tearr, Umbrian sant (L. sunt is for sant, the u being due to the analogy of thematic presents like ferunt, agunt), Norse eru 'are,' Prim. Teut isunt'i (sitt): also in the 3d plu. endings of historic tenses—Gk. '(tõuξ)an, O.H.G. (auis)nu.

The a (m-) of iouga, &c., represents a nasal sonant.

In acrists, nasal sonants appear—"χαδον (χονδ- 'seize,' I. -hend-, strong grade), έλαχον (λεγχ- 'obțain,' cp. λέλεγχα, with strong grade).

βαίνω (gwnió) is an example of a present with nasal sonant.

Nasal sonants appear in the verbal varif; *stretched,' tentus (vt-); in criparus (vt-), 3d sing. perf. pass. (cp. phies, strong grade); in *j*pupus (vm-), 1st plu. perf. (cp. y/yvse, strong grade); in norist iterapus (vm-); in the 3d plu. endings -are----are (vt-); in the aorist infinitives required (vm-), armin (vm-), armin (vm), &c.; and in the participial suffixes Sk. -ant-, Gk. arm(logitary) (vt-); and Sk. at, L. -cutt ((vml kml.) (vt-).

Note Doric susse, nom. sing. fem. pres. part. (suff).

In Sk. asma-, Æolic ἄμμως, Att. ἄμμῶς, (rough breathing due to the influence of ὑμῶς, where it equals j), Prim. Gk. ἀσμ-, Goth. υπς, we have the representatives of an I.E. type containing a nasal sonant, viz., J.E. næme-.

φρασί (Pindar) for φρησι is linguistically more correct than Attic φρησί (1 imported from other cases); διόμασι is for διομησι; (διο)μα, (no)men, for my.

in the acc. plu. suffix, there was once heard a nasal sonant (-us)—Sk. (nāv)as, Gk. (nī)ας, L. (nāv)ēs.

In Goth, acc, sing, (fot)n, the -n (Gk.-a, L.-en) is for m.
In in-fa (Goth, ninn, &c.), a represents v; novem has
taken after deem, septem. Spinuse, decining, &c., are for
septumor, dekymor. L. -oneus, Josus seen in formönnus, formönns, is for -opensso- (opun+to). — up is the weak form of
suffix- and t. &c. noner. Gk. + form.).

CHAPTER IV.

SOUND RELATIONS IN INDO-EUROPEAN-EXPLOSIVES.

In this chapter the explosives (labials, dentals, palatals, velars) are treated. The following is a table illustrating their representation in the languages under consideration:—

1.1.	b'r.	G).	1-	Goth.	, A.S.	O.H.G.
p.	. Ъ	-	P	P.	P.	P
b	b \	β	ь	P	P	pf, ff, f
bh	bh	φ	6	ь	ь	l., p
t	ı.	7	-	th, d	th, d	d, t
d	d	8	d	·	ı	1
đh	dh .	0	f b d	d	d	1
k	£(ç).	K	c	h, g	h, g	h, g, k
g	j	7	g	k	c	ech, ch hh, h

1.E.	Sk	Gk.	L.	Goth.	A.S.	O.H.G.
gh	h	x	h, g	g :	g	g, k (c)
k ⁿ	k, c	T, 7, E	qu, c Teutonic, with developme in O.H.G. as in palatal			
		1 _		hw,	gw, f, b,	h,g
g ^y	g. j	βξγ	gu, v, g	kw	(cw), p,	k (c) .
gh ⁿ	gh, h	φ, θ, χ	gu, v, g, f, b, h		w, g	·

p: Sk. pátāmi 'I fly,' Gk. cívenas, L. pelö, A.S. feder 'feather,' O.H.G. federa (G. feder) (pot-).

b: L. labium (= lebium), A.S. lippe, O.H.G. left (fs for ps, prim. Germ. lepas—G. lippe is of Niederdeutsch origin, the Oberdeutsch form is lefte) (leb.). The a in L. labium is 'probably due to association with lambē.

bh: Sk. nābhis (nōbh-), Gk. ἐμφαλές, L. umbō umbilicus (ombh-), A.S. nafu 'nave' nafela, O.H.G. naba, nabolo (G. nabe, nabel) (nobh-).

The labials were stops formed between the lips. In Teutonic, f (orig. p) had a labio-dental position.

δ was the least common of the labials in Indo-European. In Sanskrit, the labials remain. Aspirate labials lose their aspiration before the initial aspirate of the succeeding syllable. This holds good also for Greek (see Grassman's common the succeeding syllable.

Law, Chap. VII.).

For examples of labials in Sanskrit take ndpāt—'grandson,' Gk. n'erobe, 'children' (d' through popular association with rôbe, quasi 'qui pedum usu carent'). deschoic

(=-νεσείοε), cp. Sk. naptis 'grand-daughter, niece,' L. naptis, A.S. and O.H.G. nift, L. nepōs, Goth, nift)jis 'kinsman,' A.S. nefa 'nephew,' O.H.G. nefo (G. nefō) (nepōt), nepot-, nepot-, nepōt-, nepōt-, nepōt-, nepōt-, nepōt-, sabar- 'nectar,' A.S. sap 'juice,' O.H.G. saf (G. saft) (sab-, but sap- also occurs, as in L. sapiō). Wharton brings sapiō (pretonic a into e-cp. capiō (=ce)o) (kwep-), Oth. hafjan 'raise,' A.S. hebban (i-umlaut of a (orig. o)), O.H.G. heffen heven (G. heben) (kwop-)) under sep-, and compares A.S. sefan 'understand' (sep-), and Gk. δπός 'juice' (sop-).

Resuming examples we have δhāmi, Gk. φύω (Lesb. φύω), L. fui (fwū) fiō (fūō), A.S. būan, O.H.G. būan (bhā¹), cp. A.S. bōan (bhaṭ), i budhnás (bhudnas) 'root,' Gk. πυθμήπ (φυθμηπ) 'bottom' (bhudh-), Gk. πυθωξ, L. fundus (bhundh-), A.S. botm, O.H.G. bodam (G. boden) (bhud-); bōdhati' awakes,' Gk. πυθωμωι, Goth. (anaþindan 'command', A.S. bōdoam (E. bid 'command'), O.H.G. biotan (G. bieten) (bheydh-). bh sometimes appears in Sanskrit as h—χεληφīni beside

bh sometimes appears in Sanskrit as h-grhņāmi beside older grbhņāmi 'I seize.'

In Greek, the labial tenues and mediae remain, the labial mediae aspiratae are changed into tenues aspiratae. After the historical period the mediae became voiced spirants, and the tenues aspiratae, voiceless spirants.

Examples of the retention of labials in Greek have appeared above.

Note the following transmutations: — φροῦδος 'gone away' (φ before ρ), for προυδος (πρό, δόξε) ; ἔφοδος for ἐπδοες ; ὅμμα for ὁπμα ; σκοείω (for σπονεω) (spok-), cp. σκέπτομαι, L. speciö, O.H.G. speciō (G. spāllen) (spok-).

Gk. βν and βμ become μν and μμ—μνάομαι 'woo' from *βνα 'wife' (gunā-), cp. Bœot. βανά 'woman' (gunnā-);

άμεθς (for άβιος), L. ägents (agunos); ειμεθς (for ειβες) belonging to είβεμαι 'reverence' (tjegu-)—σ for σ σ (from t_1), see Chap. III., under t_2 ; ερίμμα (for εtββμα).

An aspirate loses its aspiration when the next syllable begins with an aspirate—whether, as above; \$\frac{\text{def}}{\text{sphere}}\$ (for cuters, by association with \$\frac{\text{def}}{\text{sphere}}\$, \$\int_{\text{col}} \text{def}'\$ (both. \$\text{bot}' \text{log}', \text{def}'), A.S. \$\text{def} (\(\def{\text{col}}\text{maint of a (orig. \$\text{a}\))} \); \(\def{\text{col}}\text{def}' \text{log}', \text{def}'), perhaps because these were felt to consist of two elements.

δλέβω 'press' is for φλέβω, L. fligō (bhligā-); κόπτω 'bend.' L. ανόō. is from (κουbh-).

cr appears initially in Greek for c—cross, crisiques, dialectic for cibes, cibeses. Note also crispa (L. perna), crisess (winnow' (L. pinsis), crisis (fem' (Sk. parydin 'wing, leaf,' A.S. fearn), Ck. crossis (elm,' (L. titla 'linden' (l')). For crisis (spin, cn. L. swa) see Chan III., under i.

(7)). For ervis (spin, cp. L. spun), see Chap. III., under f. In 'Latin, p' and b usually remain. bh became ph, and through an affricate (i.e. an explosive + related spirant), passed into f. Medially bh became b—orbus 'bereft,' Gk. ispanis, Goth. arbju 'heir' (prop. 'orphan') arbi 'inheritance,' A.S. syfe (b) (y or ie=i-umlaut of a) 'inheritance,' O.H.G. arbse and cross 'heir,' arbi and croi 'inheritance' (G. erbe 'heir' and 'inheritance') (orbh-); tibi, 'Sk. tibihsma.

Sometimes b appears initially—barba, A.S. beard, O.H.G. bart (G. bart).

δå also appears initially as λ-herλs, cp. Gk, φίβα 'feed.' aδ (Gk, δεθ, δ (Gk, lef), nzê (Gk, lef) originally ended in tenues, retained in aperië and φρετιξο lut took over from abdasē, δcc., the mediae. In such words, the media was not always pronounced as written, e.g., obtinité is written with δ, but pronounced as definie.

Note these:—asports for apsports, astendo for opstendo, somus for spins (cp. sopon), omnis for opits (cp. ph), davanum for dapanum (cp. daps), scannum for scalnum (cp. scaledlum), Sannium for Sainium (cp. Saini), and avunis for abuis (abhar, cp. Ir. abann, E. Avon), cp. also Sis. dmbbas' vatar' (ambb.).

Before speaking of the representation of the original explosives in Teutonic, it is necessary to put down something about the Old High German dialects.

There are the Upper German, consisting of varieties— Alemannic and Bavarian—proper to the highlands of Southern Germany, and the Middle German, consisting

of several varieties of Franconian.

The Middle German dialects are so called because of their position between Upper and Lower German.

It is sometimes convenient, for the sake of distinctiveness, to use the term Oberdeutsch instead of Upper German. In Teutonic, \$ shifted to f, and medially, when the vowel immediately preceding did not have the principal accent, to 5 (the voiced labial spirant), by what is called Verner's

Law (see Chap. VII.). This b was everywhere stopped into b after nasals; in Gothic, it also became b after r and l, remaining a spirant elsewhere, though this is not brought out by the writing.

This sound remained a spirant in the other West Germanic dialects, but in High German passed into b, which in Oberdeutsch partially became p.

f stood in Anglo-Saxon, initially, for the breath, and medially (unless when geminated, or in the groups ft ft), for the voiced spirant.

Original b became p in Teutonic. This sound in High

German (in Rhenish Franconian only after b and r) passed initially, and after consonants, into the affiricate ff(bh); between vowels it passed into ff(f). Dialectically, ffinitial, and medial after consonants, became f(ff).

Original bh in Teutonic became b. In Norse, on the oldest runic monuments, the spirant still appeared. When initial, this sound in Gothic and West Germanic was stopped into b.

The b, in Oberdeutsch, passed into p. Medially, the voiced spirant from original bh, shared the fate of the voiced spirant, got by Verner's Law from original p.

spirant, got by Verner's Law non original p.

For examples of original p into f, take Goth. fraithnan,

A.S. frekt 'oracle,' frignan; L. preor (prek.); Goth. hiffus

'thief' (E. (shop)lifter), Ck. 2\(\text{korne}, \cap \text{cp. L. cleper.}\)

For p into b through b take A.S. cofor (co=u-umlaut; f to read as bi 'boar' (E. York (Exformit) = Boar's Town), O.H.G. cbur (G. cber), L. aper (opré); Goth. A.S. and O.H.G. sibus (seppn), St. sophd, Ck. icrd, L. septem (seppn).

In Gothic this b (b) owing to local causes (finally or before s) sometimes appears as f - af of and abu (= af + u (enclit-interrog, particle)).

As additional examples of original b, take Goth, hilpan, A.S. helpan, O.H.G. helphan and helfan; Goth. slepan, A.S. slepan, O.H.G. slafan (sleb-).

The following are examples of original bh—Goth. beitan, A.S. bitan, O.H.C. bijjan (bheld.), cp. L. findő (bhid.); Goth. böña 'letter,' A.S. bör böre (f from ō by śamhaut) 'beech,' O.H.C. buccha (G. buch), Gk. pvyls' cak,' L. fōgun, 'beech'; A.S. biru borce (wo breaking) 'birch', O.H.C. birche birtha' (G. birks) (bherg-), cp. Sk. bhārjas, L. frāxinus (frāgtinus) (bhīg-); Goth. halbō 'cow-cali,' A.S. cast' (f as b, cs—braking of a (orig. o)), O.H.C. kaiba (G. kab), Sk.

garbhas 'embryo,' G. 667.96; (for \$67.96; 6 borrowed from ô1).0:5), ô12.25; (âô17.96; = couterinns) (gwolbh- and gwelbh-); A.S. balea (T., banik), O.H.G. balko (G. balken) (bholg.), Gk.

ediave 'bar, line ' (bhing-). Symptimes, from local causes, the b got from original bh appears in Gothic as f-liufs 'dear,' liubis (5) genit., A.S. lenf (F., lief), O.H.G. liob (G. lieb) (leubh-), cp. L. libet lubet

(lubh). ti (orig. #) before i becomes in West Germanic bb. This

in O'oerdeutsch passes into pp-O.H.G. uppig 'ill-natured' (G. äppig 'luxurious'), cp. Goth. ufjo 'superfluity.'

This also happens with the 5 that is got from original bh -Goth, silvia (b) 'relationship,' A.S. sib sibbe genit., O.H.G. sippia sippa, Sk. sabhā- 'assembly.'

p (urig. b) before i (r, l, and w), became pp in West (jermanic-A.S. lippe (L. labium for lebium).

This pp passed into pf in High German (not in Rhenish Franconian).

In the combination sp, original p remains in Teutonic-(ioth. speiwan 'vomit,' cp. L. spuo ; A.S. wasp, L. pespa

(uosp-). For the result of I.E. pn, bn, and bhn in Teutonic, see

Chapter on Grimm's Law.

t: Sk. tanômi, Gk. raiva, L. tendô (ten-), Goth. uf banjan 'stretch out,' A.S. aceiian (e from a (orig. o) by i-umlaut) (ton-), O.H.G. dunni 'thin' (tnnú).

d: Sk. svādis, Gr. ibbs, L. suāvis, A.S. swēte, O.H.G. suori (G. süss) (suad-), Goth. suts (sud-).

dh: Sk. êdhas 'fireplace,' Gk. a'llu, L. aedës priv. 'hearth,' A.S. ad 'funeral pile,' ast 'siccatorium' (E. oast-

house) 'kiln for drying hops,' O.H.G. eit (aidh-).

The dentals were stops formed by the pressure of the front part of the tongue against the upper teeth. Gk. & had an interdental position.

There is a class of dentals in Sanski'l (t, d, d) called cerebrals, cacuminals, or linguals, formed by the pressure of the turned-up tip of the retracted tongue against the dome of the palate. In transcribing our dentals, Hindoos use their cerebrals.

The dentals remain in Sanskrit, subject of course to some ordinary assimilative influences. I, for example, changes into I (lingual I) after sh (lingual sibilant)—athlita (Cik. loro); d becomes f before f—majf 'dive,' cp. madgds 'water-fowl,' I. merro' (meddes).

Before dh, d becomes z and then drops, with lengthening of preceding vowel— $(d\bar{c}hi\ (azdh\ becoming\ \bar{c}dh)$, give, z sing. imperat. (dedzdh) of $d\bar{c}$, to give.

Naturally then ddh will give the same result as zdh. For example of latter combination, take Sk. čdhi 'be,' cp. Gk. čel' (see Chapter III., under z).

For ordinary examples of dentals in Sanskrit, take ta, cfk, vô, L. (is)tum, Goth. pa- (as in pata neat of sa 'this, that, the?), A.S. δa (as in δet 'that, the?) (to-); part. suffix-nt, seen in bhdrantam, Gk. είγωνα, L. ferentem, Goth. bairundi, A.S. berende, O.H.G. berenti; sadas, Gk. tõe, L. seiseh, Goth. sitem, A.S. situa (tt-e)f), O.H.G. sizem (G. sizem) (sada); chiá 'cut off, 'Gk. eg/ζω, L. seindö (skhuld, skhulnd-); śrudhi srutás, Gk. szök szoróg, L. cheö indutis, A.S. hlid 'olud', O.H.G. hht (klid), cp. Sk. frávos 'sound,' Gk. szó(f)es, Goth. hliuma 'hearing,' A.S. hlivosor, O.H.G. hliuma 'renown' (kleu-), and A.S. hligton (y=-i-umlaut of čá) (klou-); Sk. mádhi 'honer,' Ck. ušob. A.S. measts

'mead' (eo=u-umlaut of e), O.H.G. meta meto (G. meth) (medhu-).

In Sanskrit (and Greek) dh becomes d before the initial aspirate of the succeeding syllable—Sk. dádhāti 'places' (dhadhāti), 6k. τόθησι; dih 'smear,' L. fingō figūra (dhigh-), 6k. τόγχος, Goth. deigan 'mould' (dheigh-), Gk. τόγχος, -Gk. dáigs 'dough,' A.S. dāg, O.H.G. teig (G. teig) (dhoigh-).

In Greek, t and d remain, dh becomes θ . δ and θ later on developed spirancy.

Examples of t are: — ἔτος, Sk. vatsás 'calf,' L. vetus (vitulus 'calf' (iταλός)), Goth. wiprus 'lamb' (yearling), A.S. weŏer, O.H.G. widar (G. widder) (yet-).

t medial often becomes s before t unless preceded by s

—δίδωσ (but δίστ), φάστς (but also by form-association
φάτις, πλούστος (but also αἴτιος)). Compare also σύ (τύπ),
L. tī, cp. Goth. δῦ.

τį and τχ have been alluded to under į and χ.

ts becomes first ss then s—ποσσί ποσί (ποτσι); tth (th) becomes sth—οίσθα (Sk. véttha).

τέθρισσον 'four-horse chariot' = τετρισσον, δέσποινα = δεσποτεία, είνασι (μεἰκητί, with o for a from numerals in -κοντα), cp. Dor. Fίκατι,

As examples of d in Greek, take χρεμίζω 'neigh,' for χρεμιδίω, L. frendō fremō, A.S. grim 'cruel,' gremettan 'roar,' O.H.G. grim, (ghurem-), Gk. χρέμως 'noise,' Goth. gramgan, A.S. grom (gram) 'fierce,' O.H.G. gram, gramizzon (ghurom-); Gk. δύς 'mis,' Sk. dus, Goth. tuz-, O.H.G. zur- (G. zer-).

For by and by see Chapter III., under i and u.

ραίνω 'sprinkle' is for ραδνίω, cp. ἄρδω 'water'; του.
'know' is from uizdhí, Sk. viddhí; ὐστέρα 'womb' is for

υδετρα ('regular before v, even when no consonant has been lost), cp. Sk. uddram, and L. uterus (utero- got from udtero-by influence of an utro- coming from udtro-).

γλυκός may be an assimilation for δίδκυς, L. dulcis (adliquis).

For example of dh in Greek take embasse (for embasse) 'father-in-law,' Sk. bandhus 'a relation,' L. (of fendix knot,' Goth. biudan, A.S. bindan, O.H.G. bintan (G. biuden) (bhendh.).

ê becomies τ before the initial aspirate of the succeeding syllable—πιθερές, as above; τθίσμι το θιθομι; τιθμές 'law,' but also dialectically, by form-association, θιθμές; τίθητι for θιθερί. The forms πίμθω 'tread' and πτίμουλω' 'pressed olives'

indicate a root with unstable consonant, now a media, now a media aspirata. f and d usually remain in Latin. dh after becoming a

hard_aspirate passed through an intermediate affricate into the dental spirant.

Afterwards this was written f initially, and inedially, in certain surroundings, viz., before and after r (not in rpu, for example—arzhux), before l, and after u (u), and perhaps.

f in Latin was a sound of a composite character, with 'dental as well as labial leanings.

Medial f was afterwards stopped into b.

Medially, in other surroundings, the dental spirant, which had presumably remained, was stopped into d (Oscan f.)

As example of t in Latin, take uter (for quoter (f)), Sk. katards, Gk. σύτιρος, Goth. hwahar, A.S. hwaver, O.H.G. hwedar (kwotero-).

Before I, t in Latin appears as &, except initially and.

in the complex st! ((t)\tilde{a}tus, stlis, also sclis, (s')\tilde{c}ocus\)— (sae)\tilde{c}um' 'race,' Gk. (\tilde{a}ty\tilde{r}\tilde{c}se') \tilde{b}ilge-water,' cp. the relation between L. vet(u)\tilde{l}us and L.L. vec(us (It. vecchio). It may be mentioned that this change of t into k appears in Lithuanian and Modern Greek.

The combination ts appears as ss, which after a long syllable, and finally, passes into s—concussi for concutsi, snāsi for snātsī(-ds-), ferēns for ferēnts.

 $tt(t^st)$ appears as ss everywhere except before r.

After a long syllable this passes into s—fessus for fettus, vicēnsimus for vicent*timus. Later tt remains—cette for ce(d)ite, attulī for actulī.

Note the following transformations:—pecco for petco, i.e., pedco (pēs pedis), sicus for sitcus (sitis), quicquam for quitquam, i.e., quidquam, topper 'speedily' for totper, i.e., todper (tod, cp. (is)tud, Sk. tad neut.).

ipse is for ispte (ipse = is declined with suffix pte), but afterwards took after iste and ille); quartus is for ctvartus. (kttbië) cp. Sk. caturthás 'fourth'; os ossis is for ost-, but has taken after äs assis; vicēni is for vicentni (yūknpt); penna (O.L. pesna) is for petsnā; scāla is for scanslā scantslā (scandā); fastidium is for fastifidium (fastus 'pride' and taedium); discā is for ditescā, i.e., didescā, cp. Gk. drād(x)exw; rāmus for retnus, Gk. ipsruho.

d appears as I in Latin, at the beginning and middle of a few words.* Initially, the d is followed by a vowel, medially it is flanked by vowels. The interchange is intelligible. There is not so much difference between the sounds, d

^{*} Conway (Brug. Jour. Vol. II., p. 163) makes this out to be a characteristic of the Sabine dialect. *Litenza*, the modern name of *Horace's Digentia*, has brought down to us the *l* of the Sabine name.

being the point-stop-voice, and l the point-side-voice, i.e., the stoppage which is complete in the case of d, is dispensed with laterally in the case of l.

Take as examples—herrinn, older diernum, Gk. básvu, Goth. lagr, A.S. löur (by contr. from tohur), O.H.G. zahur (G. zährr) (dalar); löwir 'husband's brother' (the i due to association with vir), Sk. drodr, Gk. básje bach's, A.S. drow, O.H.G. zeithhur (dalpdr. dajur); alei, qp. ador, Gk. bási; 'way'; mihu 'mast' for miðus, A.S. mest (masdos); calmins, qp. O.L. adamints.

Words in which d appears as r-arbiter, arcesso, apor = apud-are dialectic forms.

For di and dy refer back to i and y, Chap. III.

ddh (d*dh) passes in Latin to st through zdh and sth astis; cp. Goth. hnza 'treasure'; hasta 'spear,' cp. Goth. gazd; 'goad.' credō, cp. Sk. sriddhā 'believe' (kred-'heart,' dhè-dhè-'put') has not undergone this process.

att results in ss, and after long syllables, in s—laxists—lattus, Coth. Aust. 'laxy', A.S. Act 'late,' O.H.G. Ach' (G. laxy) (Isd.), op. Goth. Attan 'let,' A.S. Actan, O.H.G. Achyon, (C. Aussen) (Isde.), and Goth. Istalia (pt. simp.) (Isde.); spistus — spistus, G.K. orbig. (Vorous). (Suppl.); fraints:—fraidts, from fraus (bhrougd.); acushus 'light-blue' for acaddins, A.S. Ackard (bhrougd.); acushus 'light-blue' for acaddins, A.S. Ackard (O.H.G. Ackard (C. Ackard) (Susakard).

Note the following transformations:— sella for sedlā, Goth. sitls, A.S. setl (E. settle), O.H.G. seppal (G. sessel (sech.); rāllum for rādlum from rādo (fd. cp. rādō (rād.)); acger for adger (gerð); acementum 'hewn-atone' for acedmentum from acedo (krādlah.), cp. Goth. skátdan 'sessel rate,' A.S. sc(c)adan, O.H.G. sceidan (G. scheiten) (skuaidh-), and Gk. ozi(w. L. scindo (skhvind-, skhvid-); ramentum 'shavings,' for radmentum (rado); flamen, for fladmen, Goth.

blotau 'worship' (bhlad-),

For example of dh (Prim. Ital. b) as f, take felare 'suck,' Gk. δηλυς 'female' (dhēl-), cp. Gk. δησθαι 'suck,' L. fēmina (dhē-), also Goth. daddjan 'suckle' (dho-).

dh appears as b in ūber, Sk. ūdhar-, A.S. ūder 'udder,' O.H.G. ūtar (G. enter), cp. Gk. 630ap; jnbeo, shortened from O.L. joubeo, for jondheo (jūs, jons+dhe-'put'); glaber

'smooth,' A.S. glad (E. glad), O.H.G. glat 'smooth' (G. glatt) (ghyladh-); rnber, Sk. rndhirás, Gk. śpodośc rudhr-). L. rūfus (roudh-) is a dialect word); verbum for vorbum,

Goth, waird, A.S. word, O.H.G. wort (G. wort) (urdh-). dh also appears as b in suffixes-L. bro (Ital. fro), Gk.

Opo, e.g., cribrum 'sieve,' A.S. hrider hridel (hridder hriddel) 'riddle,' O.H.G. ritara (G. reiter) (kri-), cp. Goth. hráins 'clean,' O.H.G. reini (G. rein) (kroj.) ;-1. blo (Ital. flo), D.o, e.g., stabulum.

As d, dh is found in fidelia 'pot,' Gk. widos 'jar' (bhidh-); in fides 'faith' (bhidh-), cp. fidus, Gk. σείθω (bheidh-); in fodio, Gk. βόθρος (for ποθρος), Goth. badi, A.S.

bed (i-umlaut of a (orig. o)), O.H.G. beti betti (G. bett) (bhodh-); arduns, Sk. ūrdhvás 'rising,' Gk. öpbis (rdhuós); vidnus (for viduvus vidovus), Gk. hídeos (hFideFos) 'bachelor,' Sk. vidháva 'widow,' Goth. rvidurvo, A.S. rvid(n)rve, O.H.G.

witurea (G. wittwe) (widh-, seen also in divido, and Gk. Ισθμίς $(=Fi\theta\theta\mu\sigma\varepsilon)).$

Notice also Oscan Venafrum 'hunting ground' (vēnor however has \tilde{e}).

Note these: - monstrum, for mondtrum (mondh-), cp.

ferently.

Gk. unbir Goth. mundēn 'consider' (mndh-); insensus, for insendius (sendē, Gk. bisu (for buju) 'strike'); jusū, for judhsī.

In Teutonic, original shifted to p, and medially, when the vowel immediately preceding did not have the principal accent, to d (the voiced dental spirant), by what is called Verner's Law (see Chap. VII.).

This d was everywhere stopped into d after nasals; in Gothic it also became d after r and l, remaining a spirant elsewhere, though this is not brought out by the writing.

The West Germanic dialects changed every other d into d_1 this d in Oberdeutsch (also in East Franconian) became l. It should be added that p, with principal account preceding, became δ (represented by lh, more rarely by dh) in

High German, which in the Old High German period passed at various dates, beginning c. 750 A.D. in Bavaria, into d. In Anglo-Saxon the characters h and δ were used indif-

Original d becomes l in Teutonic. This sound in High German passed everywhere into z, i.e., the affricate ls, when initial (but not before r), and when post-consonantal (but not

after s); after vowels it passed into \$\(\tilde{r}\)(\(\tilde{r}\)) (an \(\tilde{r}\) sound).

Original \(dh\) in Teutonic becomes d. In Norse, on the oldest runic monuments, the spirant still appeared.

When initial, this sound, in Gothic and West Germanic, was stopped into d.

The d passed into t in Oberdeutsch.

Medially, the voiced spirant from original dh shared the fate of the voiced spirant got by Verner's Law from original t.

For examples of original t in Teutonic take Goth.

wairþan, A.S. weorðan (w = breaking of e), (E. worth vb.), O.H.G. werdan (G. werden), Sk. wártatē 'turns' itself' (uert-), L. verið wortð (uort-); O.H.G. hadara 'rag' (G. hader) (kuot-), M.H.G. hadel (from which French haillon), L. centā 'patch-work' (kuont-).

ts results in ss and s—O.H.G. wissun 'they knew' (uitstħ, rt.uejā-); Goth. anabusns (for anabutsns) 'command,' Gk. πυθέσθαι (bludh-), from anabudan 'bid,' Sk. bådhāmi 't awake,' Gk. πιθόσια, A.S. bēodan (E. bid 'order'), O.H.G. biotan (G. bieten) (bheudh-).

Original tt results in (#1) ss, but not before r, and, after a long syllable, in s—O.H.G. giveis(ss) (G. gewiss) 'certain,' giveiso' adv., Gk. (Å) 1670; 'unknown' (uitžés, rt.upid-); A.S. &s 'food, carrion,' O.H.G. &s (G. aas), L. Esus 'an eating' (&tž60, rt. ed. 'eat').

Before r, a t might give st (through |tt)—A.S. főstor

Before r, a / might give st (through |t/)—λ.S. föstor (food) cp. Goth. föstjan (feed) A.S. föda (food) O.H.G. finotar (G. futter) (påt), and Gk. σατίσιαι, O.H.G. fatunga (food) (pat).

th gives sh—O.H.G. rase (G. rasch, cp. E. rash) (rathuaz), said to be from O.H.G. rad 'wheel,' L. rota (rot-).

In mh, an f seems to have been generated in High German—O.H.G. kumft 'a coming' (G. -kunft), Goth. (ga)kwunhs 'assembly.'

Other examples of the insertion of f in the combination mp, are O.H.G. firnung? (G. vernung? '(reason'), from O.H.G. firnung (G. vernung? '(and O.H.G. zumf! (G. zumf! 'guild,' orig. 'regulation'), from O.H.G. zeman (G. ziemen' beseem')—both with suffix it (Goth. pr). For mf into mf in the above, compare md into nd (see Chap. III., under m).

A similar insertion of s is met with in the case of the combination np—O.H.G. kunst 'art,' cp. Goth. kunp's 'knowledge.'

Original s also appears in Teutonic as st, when the vowel immediately preceding does not have the principal accent —Goth. meds, A.S. weds (E. weest, Sc. wund), cp. A.S. Wöden, web 's lequence', webbers' orator', O.H.G. wund (G. wents), L. witts (whis), A.S. wend (E. depthy)), O.H.G. and (G. cuts), antrahibe (G. cuts), S. wend; S. depthy), O.H.G. and (G. cuts), antrahibe (G. cuts), L. cuus (anath), cp. Sk. dist, Gir. ñeest (es=v) (Eth); Goth. hardus' hard, A.S. hard (es=breaking of a), O.H.G. hard, cp. with weak-grade vowel, Gk. sperie; Goth. haidus' manner, A.S. had (E. sheen), O.H.G. hait (G. sheit), Sk. hätis' from (Neotjeks).

A.S. syun (y=i-umlaut of u), O.H.G. suntea, sunta (G. sünde), Teut. base sunjō for sundjō (sntjā), cp. A:S. sev 'true' (sonto-), and L. sonticus 'genuine.'

In Gothic, this d (d) appears as p, finally, and before stamelys ' tamed,' genit. tamidis (d).

In West Germanic d_i (d_i), orig. t_i, by gemination resulted in dd, which everywhere in High German shifted to tt—Goth. pridja (d), A.S. öridda, O.H.G. dritte (G. dritte), cp. Sk. trifyas, L. terlius.

t remains when associated with a preceding spirant footh, ist, O.H.G. ist, A.S. is (t final in an unstressed word drops), Gk. iev, L. est; Goth. hiffus 'thief' (E. (thop)tifler), Gk. xxievus; Goth. rathst 'right,' A.S. ratht (so = breaking of c), O.H.G. ratht (G. reth), Gk. (d)vsrvis, L. retus (rektos). Note the passage in a few West Germanic (and Norse) words of initial bt (orig. tt) into f—A.S. fifon 'flee,' O.H.G. flohau (G. fifichen). Goth. britishen, and compare the change (see above) of Prim. Ital. by and by linto f f (L. br bt). For examples of original d in Teutonic take Goth. tinhan' draw, A.S. tōon (tau(h)on), O.H.G. tiohan (G. siehen), L. divē (O.L. doncē = dencē) (deuk.); Goth. witan 'know, A.S. witan, O.H.G. wibšpan (G. wissen), Gk. hōn, L. videō (uid.), cp. Fsibor (usid.), and Sk. wida, Gk. Foiba, Goth. woh; A.S. wida (E. woh), O.H.G. web; (G. weiss) (uold.).

In Old High German, before initial r, t (orig. d) remains
—O.H.G. triuwa 'fidelity' (G. treue, Fr. tribe 'truce' is borrowed from the German), Goth. triggwa, A.S. tržow; it

also remains after s(s)—O.H.G. ast 'branch,' Goth. asts, Gk. & of, cp. A.S. & of (& dos); A.S. mest 'mast' ('fruit of oak,' &c.), O.H.G. mast (G. mast) (mazdos). Teut. t (orig. d') before f gives by gemination tt, which in

High German shifts to zs, but remains before r—Goth. latjan 'tarry,' lats 'slothful,' A.S. lettan 'hinder,' O.H.G. lezsan (G. letsen) (lød-), cp. Goth. lölan, A.S. lötlan 'let, O.H.G. löppan (G. latsen) (lød-); O.H.G. hlüttar 'clear' (G. lanter), Goth. lättrs, A.S. hlüttar, Gk. zh.lu (g. | zh.ublu)

'wash' (klūd-), cp. doāca (clovāca) 'sewer' (klou-).

The combination dāh (d=dh) gives in Teutonic the result zd—Goth. huzd, &c. (kud=dho-) (see Chapter III., under z).

As examples of original dh in Teutonic take Goth. bindan, A.S. bindan, O.H.G. bintan, L. offendix 'knot' (hhand); Goth. grids, L. gradus (for gredis) (ghuredh-); Goth. misdō, A.S. meord (W.S. mēd, E. meed), O.H.G. mēta (ē = contraction of is) mieta, miata (G. miethe), Gk. µnobis (misdhó, misdhó.).

Sometimes, from local causes, the d got from original dh appears in Gothic as p—compare rdups 'red' with genit. rdudis (d) (roudh-).

d (orig. dh) before i gives by gemination dd, which shifts

everywhere in High German to tt.—Goth. bidjan 'ask' (d), , A.S. biddan (E. bid 'pray'), O.H.G. bitten (G. bitten), Gk cribu (bhidh-, bheldh-).

For original tn, dn, and dhn in Teutonic, see Chapter on Grimm's Law.

In all European languages the combination of original media aspirata + t has the same representation as original tenuis + t—GL. porté, L. absorpti (arobh., grbh.); A.S. weff (A.S. wefan 'weave,' O.H.G. weben (G. weben)) (publ.), co. Gk. Jose,' web.' weave,' weave,' (bbb.)

k: Sk. veśds 'tent,' Gk. olzos, L. vicus (nojk-), Goth. weiks 'district' (nejk-).

g: Sk. vájas 'quickness' (yōg-), Gk. vyńę (ug-), L. vegeō (= vogeō), Goth. wakjan 'watch,' A.S. wyceean (e from a by i-umlaut), O.H.G. wycehen (G. wechen) (yog-).

gh 1. Sk. rah 'carry' (uegh-), Gk. 7/20; 'chariot' (uegh-), ...
L. vehō, Goth. (ga)wigan 'move,' A.S. wegan, O.H.G. wegan (G. (be)wegan) (uegh-).

A reference to the preliminary account given of the palatals (Chap. II.) will show that h, g, and gh are represented in Sanskrit by s, j, and h.

Take as examples of k, diman 'stone,' Gk. āu,uar 'auvil'; pii' 'adorn,' Gk. ewnhae, L. pictūra, Goth. filik, A.S. fāk 'variegated,' O.H.G. fāk 'G. fāke 'Siberian squircel,' 'das Eichhornfell verschiedenfarbig war' Weigand) (peik., poik-).

A root-ending in a velar gives similar words in Teutonic

Goth. fith 'deception,' A.S. fith 'hostile,' O.H.G. fith

(G. fehde 'feud'), cp. Gk. casefs 'sharp' (pelku-, piku-).

hit-hih-fishas 'bear, Gk. üpsre, L. ursus (fithos).
hi ppears as kih-dikhiinsi 'right, elever' ('south,'
ej, Deccan), Gk. örğös, L. dexter, Goth. taihswa 'the righthand, finally as k (but note shduh, L. sex, Goth. salhs).

sk = ch (ch)—Sk. pṛchâmi, L. pōscō (porescō, O.H.G. forscōn (G. forschen) (pṛkṣkō), cp. L. precor, Goth. frathnan 'ask' (pṛek-).

As example of g take janas 'people,' Gk. yive, L. genus (gen-), Goth. kuni, A.S. cynn (y=i-umlaut of u) (gn-).
g is represented by h in aham, Gk. iyo iyon, L. egő,

Goth. ik, A.S. ic, O.H.G. ih.

gd and gdh become respectively d and dh, while gbh
results in dbh.

For examples of gh in Sanskrit take bāhtis 'arm,' Gk. αῆχυς (Dor. αᾶχυς, for φᾶχυς), A.S. bōh (bōg) 'arm, bough,'

O.H.G. bing (bhāghā-).
gh passes to h through /h, which in certain surroundings
remains. This /h appears as / in /inhhōz pl. 'he called to,'
rt. hā, owing to the operation of the law for the dissimilation
of aspirates, examples of which in Sanskrit and Greek have

The palatals appear in Greek as z, γ , χ , γ and χ later on became spirants.

already been noted.

Take as example of k, *\lambda \text{ift} 'hear,' A.S. \text{hilid} 'loud,' O.H.G. \text{hilit} (C. laut), cp. Sk. \text{sruds} 'heard,' Gk. \text{kovids}, \text{inclustration} (Sk) ; Gk. \text{xfvs}, L. \text{clinic}, \text{clitics} 'pack-saddle' (klei-), cp. L. \text{clivur} (=\text{cloisus}) 'slop,' Goth. \text{hilito}

'sepulchral mound,' A.S. hlirw, O.H.G. leo (kloj-), cp. also. Sb. śri 'go to,' Gk. zżśua 'inclination,' A.S. hliniun, O.H.G. hlinen (G. lehnen) (kli-).

ky appears in cuts curres (co into c), Sk. (id) sound-'complete' (kuut-); theoretics; 'priest' is for theoretics (-ky-), 1. procus 'suitor' (prok-).

For knee, see Chap. III., under y.

For example of ki, note cássalos (-xi-) 'peg,' L. paciscor 'agree,' Goth. fagrs 'fit, fair,' A.S. fieger, O.H.G. fagar (nak.), and confer under i.

(pak), and conter under f.

As examples of g, take pryvious, Sk. jmö, L. ()gnöxö'
(gn6), A.S. cmöven (gn6) (cl. A.S. törnen 'som' (sk(j)), Gk.

řez-(sequ), L. zörnen), L. ingens 'huge' ('uncouth') Goth.
kmple 'known,' kunnan 'know,' A.S. röö' (compens. length.)
(E. nucouth, Sc. unen), cunnan, O.H.G. kund, chunnan (G.
können) (gp.), L. ()gmörus (gp.); prio' cause to taste,' Goth.
kinnan 'choose,' A.S. counn, O.H.G. kinnan (G. kicen) .

(gsug.), cp. Sk. junh' enjoy,' L. gustő 'taste,' A.S. quan (ye-unlaut of u), 'kiss' (gm.), and Goth. kánjan 'taste'
(goug.); 'syn, A.S. weare (co-breaking of c), O.H.G. were'
(G. werk) (ugr.), cp. Goth. weafrifun, A.S. wyriean (ye-unlaut of n). O.H.G. werchen (G. wirekn) (ugr.).

For g', confer under i,
gh is to be seen in the following:—χυών 'snow' (ghidm.),
L. hiesu (ghiam.), Sk. himtu (ghim.); 'έχω (σχέω), Sk. snh
'support,' Goth. sight 'victory' (two roots have been fused
in 'χω, νία., μεχh- and εεχh); χωμωί 'on the ground,'
Goth. guma 'man,' L. hemő (ghm.), L. humus, homő (ghom.),
χ(θ)ών (ghòm.).

For ghi, see under i.

ixxχειρία (iχω, χείρ) 'armistice' illustrates the law of the dissimilation of aspirates.

In Latin, the palatals appear as c, g, h and g. e was pronounced hard, even before e and i, down to the Middle Ages.

In Umbrian, Ital. & (I.E. k and ku) was assibilated. Compare with this the change wrought on Latin cin the Romance languages.

Take as examples of k in Latin :- porcus, A.S. fearh ' pig ' (E. farrow), O.H.G. farah (G. ferkel dimin, 'sucking pig') : juvencus 'young,' Sk. juvasás, Goth. juggs (for juvungas), A.S. geong, O.H.G. jung (fuunké-).

ku appears in canis, Sk. śvá, gen. śúnas, Gk. zww zwię, Goth, hunds, A.S. hund, O.H.G. hund (G. hund) (kuon-, kun-).

For ki see under i.

diginus is for decrees, cp. decus; e also appears for e. in septingenti, nongenti, &c., cp. ducenti. The g. however, is by some held to be original in these two words.

pulcher is dialectic for pulcer, polcer, (plku), cp. placeo

'please' (ploku) and placo 'appease (ploku); nixus is for

gniettos (gnigu-); texo, Sk. taksh 'fashion,' Gk. rizrus 'carpenter.' O.H.G. deksen 'shape' are from (tekth-): misco is

for micseo, cp. Gk. uryrous: mulsi for mulsi, cp. Sk. mars 'touch' (melk-) : pastum for pascium, from pasco : posco for porcsco (postulo = poscitulo) : sescent for sexcentui. As examples of e. take arrentum (reento-), co. Gk. & er/6c

'white' (rg-), and Goth, unairkns 'unholy,' A.S. eorcan (stan) (eo = breaking of e) 'precious stone,' O.H.G. erchan 'right, pure '(erg-).

examen is for exagmen (ex, agmen); palus 'stake' is for

paxlus (cp. paxillus 'peg') (pag-s-), cp. pango (pang-) and shrrius (pag-): narro, nascor, navus, nosco, &c., have lost e. gh appears in Latin initially (not before r) and medially (except after and before nasals, and before I) as h. Initial gh before r, or medial gh followed by I, or with preceding or following nasal, is represented by g. Dialectically, there is an Frenesentation.

For examples of h take these:—hortus 'garden,' Gk.

z/srse' 'fodder, feeding-place'; haviolus haru(z/se., from
yeezi) 'diviner, inspector of entralls,' Gk. zysh's 'gut' (ght'),
Sk. hird' gut' (ght'), A.S. gearn (a= breaking of a (orig. o)).

O.H.G. garn (G. garn) (ghox): mili, Sk. mdhyan; vehö,
Goth. (ga)migan 'move,' A.S. wegan (E. weigh), O.H.G.
wegan (G. wegen) (1988h.)

Of g representing gh, the following are examples:—granen 'grans,' A.S. gröwan, gröne (ē by i-unlaut) 'green,' O.H.G. gruoni (G. grün) (ghrā-), cp. Goth. gras 'grass,' A.S. garz (gras), O.H.G. gras (ghrā-); lingō 'lick '(sometimes written linguē, owing to a reference to linguō, A.S. licaia (licjan) ((lugh-), p. Gk. Adrya (lugh-); magnus (for magnōs, Sk. mahān, Gk. sáryas, Goth. mikils 'much,' A.S. myeel micel (the y is due to the analogy of bytl') (E. much), O.H.G. mikil mikili (mas); singuis (for perquish (Sk. ex-yeck fongha).

h (orig. gh) disappeared before i, and often when between vowels:—mājor for mahior (magis has appropriated the g of magnus); ājō for ahiō; lien, cp. Sk. phhān; bimus for bihimus; nimō for nehenā; prendō for prehenā; praebeō for praehibō; diribeō from dis and habeō, &c.

witum 'covering' is for vestum (cp. vestis = vestis, Goth. wasjan 'clothe,' A.S. werian (e-i-umlant of a (orig. e)) (100-), cp. Gk. l'nipu (Fenipu) (100-); vētum 'sail,' for vestlm (p. vestlihm), from vehã.

f, representing orig. gh, appears in fovea 'pit,' Gk. xuá 'hole' (ghenta), in fariolus for hariolus, and perhaps in

indo (ghund-), Gk. zj(F)w, Goth. gintau, A.S. gčotan (E. (in)got, O.H.G. gioșan (G. giessen) (ghau(d)-)

In Teutonic, original & shifted to h. through intermediate

voiceless spirant χ . Initially, h is simply an aspirate (but not in Gothic before consonants); medially, between vowels, this is also the case, but when a consonant follows, or the h is final, the sound is that of the guttural spirant (G, ch).

Medially, when the vowel immediately preceding did not have the principal accent, & shifted to 3 (the voiced guttural spirant), by the operation of what is called Verner's Law. This 3 was everywhere stopped into g after nasals; in

Gothic, it also became g after r and l, remaining a spirant elsewhere, though this is not brought out by the writing. In the other West German_dialects, this sound remained a spirant, but in High German it passed into g, which in Oberdeutsch partially became k.

Original g became k in Teutonic. This sound when initial, and when post-consonantal (except after s) passed in the Upper German dialects into k_Z (written ab, ch, &c.), but remained in the Middle German dialects. Between

out remained in the stitute cerman outsites. Setween vowels it everywhere became χ (written kk, k).

Original gk became 3 in Teutonic. When initial, this sound was ultimately stopped into g. In Norse, on the

sound was ultimately stopped into g. In Norse, on the oldest runic monuments, the spirant still appeared; but in Gothic, as was the case with the labial and dental spirants (orig. bit and db), it was stopped into the full consonant at an early date. In Old Saxon and Anglo-Saxon, 3 remained down to historic times.

In Oberdeutsch the g (stopped 3) passed into k (c). Medially, the voice spirant got from original gk shared the fate of the voiced spirant got by Verner's Law from original &.

For examples of k in Teutonic take A.S. hring, O.H.G. ring, G.k. spixes wipses, L. circus (krikks and Krinksh); Goth. hahipin 'laugh', A.S. khikhau (k-i-iumlaut) of a palatal umlaut of a before h), O.H.G. hlahhau (G. lacheu), schieste (xh.wie), L. gözire (klöb.) (?), A.S. hpd (y-i-iumlaut of u) 'hide,' O.H.G. hit (S. hauf) (ktikk), cp. Gk. ziese,' L. catis (kut-); Goth. (ga)(cihan 'announce,' A.S. tiou (contd. from thou) 'censure', O.H.G. zihau (G. cziheu), G. kissus, L. tiōu (O.L. de'do) (delke). A.S. szar 'kinië', C. kissus 'L. tiōu' (O.L. de'do) (delke). A.S. szar 'kinië'

(orig. made of flint), O.H.G. sahs (G. messer 'knife'=
O.H.G. mēpiras mēpitashs from O.H.G. map' (A.S. mṛte),
sahs' Speisschwert'), L. saxum; A.S. fans (x=hs) 'hait'
(E. fax(wax) fax(wax), (Fair)fax), O.H.G. fahs (pok-), L.
fett, G.K. citsu (psk-).
For an examble of the k that under the operation of

Verlier's Law became g in Teutonic, instead of h, take Goth, fager suitable, 'A.S. fager s'aint,' O.H.G. fager (G. fager vb. 'purify' (pak-); Goth fagus (3), A.S. slig, O.H.G. slig (dakm, with suffix accented), cp. Goth. failmn, A.S. finn ie-contraction and n-umlaut from teo(h)nn, the breaking of tehnn), O.H.G. scham (G. schn), Sk. ddsh, Gk. bina, I. deten

The 5 got by operation of Verner's Law by gemination became gg before in West Germanic, which gg became &k in Oberdeutsch—A.S. gg 'edge' (g=gg), O.H.G. ¿kka (G. ckk), L. agis (ak-).

(dékm, with accent on first syllable).

k remains in the combination sk—Goth. skeinan 'shine,' A.S. scinan, O.H.G. scinan (G. scheinen) (skej-), cp. with weak root, Gk. ozuń, and Sk. chāyā 'shadow.'

To illustrate the representation of g in Teutonic, take Goth. kmin, A.S. cako, O.H.G. chnin chnoe (G. knie) (gneuy, op. Gk. yko (gnau), St. jihu (ghau), I. genil (gni); Goth. kahra 'corn,' A.S. corn, O.H.G. chorn (G. korn) (grao-), cp. L. grännun (grao-); Goth. brikan, A.S. brean, O.H.G. brehhen (G. brecken), I. Fange (= Frange) (blurge).

The k got from I.E. g, associated with i, gives kk, which appears in Oberdeutsch as $k\chi$ (written ach and ach)—see typical examples of palatals.

This gemination also takes place in High German before r-acchar, Goth. akrs, Gk. ἀγρός, L. ager.

Original gh is represented in the following:—A.S. gō [6] hy compens. length. for loss of n) O.H.G. gam, Sk. hantak, I. ānser for hānser, Gk. χόν χνόε (χωνας) (ghans); Goth. gatis, A.S. gatis, O.H.G. gatis, Sk. gatis, O.H.G. gatis, Sk. gatis, O.H.G. gatis, Sk. janghō' hoel-bone' (ghenghu, ghonghu); Goth. maththut 'dung' A.S. mees for meast [7] (see = breaking of 1), O.H.G. mist for mithst (G. mist) (milgh-), p. L. mingō (mingh-), Sk. mehāmi, t sing. pres. ind., I. yujōō for mujhō, A.S. migen (majh-), Gh. (shi ya'yōu (milgh-)), Goth. daige 'dough,' A.S. dig, O.H.G. tai (G. taig), Gk. va'yoz 'wall' (thoigh-), cp. Sk. dātō' (wall,' Gk. va'yoz, 'wall' (thoigh-), cp. Sk. dātō' (wall,' Gk. va'yoz, Goth. daigen 'knead' (dheigh-'smean, knead, form') L. figāru fingō, Goth. (ga'daig' 'creature' (dhigh-); A.S. ll(wigo) 'hedgehog,' O.H.G. tail' (sigh) (S. taybaz (ga'b).

Sometimes, from local causes, the 3 got from orig. ght appears in Gothic as χ —cp. vigr (χ) 'way,' nom., with vigit (5), gen.

g (orig. gh) before i gives by gemination gg, which in Oberdeutsch shifts to kk-Goth. ligan (new formation for

ligjan), A.S. liegan, O.H.G. likken (lieken, liggen) (G. liegen). Gk. λέχος (lagh-).

For orig. ku, gu, and ghu in Teutonic, see Chap. VII.

k(v): Sk. eṛtāmī 'I tie together,' Gk. κάρταλλε, 'basket.' Goth. haūrds 'door,' A.S. hṛrdel (y=Fumlaut of u) 'hurdle.' O.H.G. hurī 'plait-work' (kvṛt-), L. erāles (kvṛt-).

kw: Sk. ca, Gk. vi, L. que, Goth. (þáu)h, A.S. (ŏča)k., O.H.G. (do)h (o from ō, owing to enclisis) (G. doch) (kwe-).

g(y): Sk. djas 'strength,' L. augeō, Goth dukan 'increase,'
duk 'also,' A.S, ēaceu 'increased,' ēac (E. cke), O.H G.
onhhōu, ouh (G. auch) (aug+).

gs: Sk. jředs 'living' Bås; (3 before i is strange, see below), L. vřezs, Goth. kveins, A.S. cave (E. guick), O.H.G. guez (G. kvel) (seçond e 'Zusatz vor dem got. w' Klugo' (gvly). There is a guttural in vizi (got from related viges, see. American Journal of Philology, xiii. 2., p. 226), so that perhaps the guttural is original.

gh(u): Gk. srsizw 'walk,' L. vestigium (?), Goth. steigan 'ascend,' A.S. stigan, O.H.G. stigan (G. steigen) (steighv.).

The Letto-Slavic cognate does not assibilate, a fact which makes for the yelar character of this guttural.

ghu: Sk. gharmas 'warmth,' Gk. espece, L. formus, A.S. wearm (ca = breaking of a (orig. o)), O.H.G. warm (Teut. (3)yarmas) (ghuerm, ghuorm-).

The velars appear without any labial modification in Sanskrit, and are represented by the guttural characters k, g, gh, except before original e and i-vowels, where they are represented by the palatals e, j, and (jh) h. It was after this palatalisation that e and f passed into e and \bar{a} . What was said about velars at the beginning of Chap. II. need not be repeated here.

For examples of the guttural representation in Sanskrit take kṛtás 'made,' cp. Gk. xpahw 'accomplish,' and L. creare (t), cerus 'creator' (Festus); gātás, Gk. βῶς, L. δῶς (from Oscan dialect, the regular Latin form would begin with v), A.S. cũ, O.H.G. chuo (G. kuh) (gwõu-); dtrghás 'long,' Gk. δολιχός, L. largus=lalgus, dalgus (the r by dissimilation) (dlghwós), cp. Goth. tulgus 'firm' (dlghwos); drāghás 'perfidy,' A.S. drām, O.H.G. troum, triogan 'deceive' (G. trigen) (dhreughu-, dhroughu-).

The following are examples of the palatalised velars—with segment of a word' (nom. νέκ, I.E. es stem), L. νων (noku), L. νωνο (uoku-), Gk. ἕνώς (ueku); Sk. jatu 'gum' (E. gutta(percha)), L. bitūmen (for δ cp. L. būs), A.S. cwidu 'resin,' O.H.G. chuti, quit' (G. kitt 'putty') (guetú-); jyň 'bowstring' (guļā), cp. Gk. βιάς 'bow' (guliā); hánti (for jhanti) (ghuenti 'he strikes'), Gk. διίω (= θινίω), L. offendō (γ), cp. φῶνος 'murder.'

The workings of analogy have often given rise to gutturals, instead of palatals, and vice versā.

The velars without labial modification are represented in Greek by x, \(\gamma, \cdot \times, \cdot

tung sp st aussiel'); "xuòo" seized' (xuoòdno has the nasal of the suffix reflected in the root) (ghuṇd.), L. (pre)htudō (ghuend.), L. pracda (for prachedō), Goth. -gilan 'get,' O.H.G. (fr)rivõsau (G. (ver)ressun') (ghued.).

With labial modification k* appears in Greek as \u03c4 before e-vowels, before lingual and nasal vowels, before liquids and nasals, and before \u03c4, \u03c4. Before \u03c4 and \u03c4 it appears as \u03c4.

Examples of \(\epsilon\) are:\(-(\cos)\)\(\alpha\)\(\epsilon\)\(\e

As example of v, take vs. as above among typical examples, and vious 'atonement,' Sk. et' observe' (kwi-), cp. worff 'fine'. (kwoinā).

& after or before v (was the v generated by the lablal modification?) appears in Greek as x—λίους, Sk. v/kat, L. lapas (dialectic for laquas), Goth. rouff, A.S. vouff, O.H.G. wolf (uftwon), cp. λλου 'draw' (yelku-); κόκλος (x*sex*λος), Sk. αδεκές, A.S. Invoogel, havio! (Teut. Invogradid-) (ksekixtó-).

With labial modification, gⁿ appears in Greek as β, before e-vowels, before lingual and nasal vowels, and before liquids and nasals. Before s it appears as δ.

Examples of β are :—βορά 'food' (gū-), βιβρώσεω (gū-), L. vorare (gūo-); βαρός, Sk. gurás, Goth. kaárus 'heavy' (gūu-), L. gravis (=grovis) (gūroy-); ἀδίνος (nom. ἀδέν)

÷

'gland,' L. inguen 'groin' (nguén-); àuvos 'lamb,' said to be for abros, cp. L. agnus.

μιάσμαι derives from *βνα 'wife' (guna), cp. Bocotian βανά 'woman' (gunnā).

As example of δ take Arcad. δέρεθρον (also ζέρεθρον, so that ôs- from gu must have been something different from ordinary δε-), Attic βάραθρον 'pit,' cp. βορά βιβρώσχω.

gu in the neighbourhood of υ appears as γ-γυνή (= yFevn), Goth. kwino 'woman, wife,' A.S. cwene, O.H.G. quena (guenā), cp. Sk. -jāni- 'wife' (cf. jánis 'wife') Goth. kwēns, A.S. cwēn (E. queen, quean) (Teut. cwōniz, see under

č) (guēni-); ελαχύς and ελαφρός; (βου)πόλος and (αί)πόλος. Does πρέσβυς (the β due to analogy of πρέσβιστος; a form mpioyus also occurs) contain the masculine of which γυνή is the feminine?

With labial modification, ghu appears in Greek as o. before o-vowels, before lingual and nasal vowels, and before liquids and nasals. Before & it appears as 0.

Examples of φ are: --φόνος 'murder,' cp. Sk. hánti 'strikes,' as above; νεφρός 'kidney,' Ital. nefrones nebrundines, M.E. (kid)neer (A.S. cvvið 'womb,' Prov. E. kite) (E.

kidney), O.H.G. nioro (G. niere) (neghur-); ἐλαφρός 'light,' A.S. lungre 'quickly,' O.H.G. lungar 'quick' (G. lungern 'long after, idle about') (lnghuró-), cp. Sk. laghús, Gk. έλαχός, A.S. lungen 'lung,' O.H.G. lunga (G. lunge)

(Inghtú-), also Goth. leihts 'light,' A.S. leoht (i shortened to i before breaking), O.H.G. liht (G. leicht) (Teut. lihta for lingta, lengta) (lenghu-), perhaps also L. levis (leghu-).

As example of θ, take θείνω ' strike,' cp. φόνος. Dialectically θ sometimes appears as ϕ —Æolic $\phi \acute{\eta} \rho = \theta \acute{\eta} \rho$.

ghu in the neighbourhood of v appears as χ-έλαχθε, as

above; for khr as χ take sug suges, Sk. nakhás, Goth. (ga)nagijan 'nail,' A.S. nagel, O.H.G. nagal (G. nagel) (nokhu-), I. naguis (onkhu-).

Some new formations, got by analogy, intermix the various representations of the original sounds—βiλω; and δολφί; after βάλλω and δολφύς.

The velars without labial modification are represented in Latin by c, g, h and g.

Take as examples: L. capiō. Goth. hafian 'heave,' A.S.

hybban, O.H.C. Arglen (Krap-) (but see Wharton's Etyma Latina, where caryō is said to be for cryfo (krap-), and krop put down as root of Teutonic forms, and Git. κόσις 'handie' instanced as example of another ablaut (krūp-)); cowa 'hip', 'Sic. Adskna' 'armpit,' O.H.G. Ankra (G. Acebra, hāchu) 'bend of the knee' (krūdka); caraō, 'Goth. hana' cock,' A.S. hqua (hana), O.H.G. hano (i. hahn); urran for urranō, cp. urrans (e-wurran) (urrku-); 1. crho (grab-), 'Goth. kaldō, A.S. cardō (e-wurran) (urrku-); 1. crho (grab-), 'Goth. kaldō, A.S. cardō (ortho 18.5), 'A.S. crist (ire l-umbaut of en, the palatal umlaut of Teut. a), O.H.G. card (grab) (grabas); L. gradus, (e-gradis), Goth. grids (gravedh-).

The different treatment of ky and k^y in Greek— $\bar{\nu}_{wwy}$ (2), Sk. divas, I. eqns (diy_{wy}), and $\bar{\nu}_{xwy}$ ($elik_{wy}$)—proves that the velar modification was not a full y. Compare the Umbrian representation of k^y by p, and of ky by ky.

With labial modification, ks appears in Latin as gu, before all vowels, save u, where c appears—guic, Gk. vic, Sk. kim neut. (with k for c, taking after the masculine kit) (twi-) op. kit "who?" Gk. wirsyes, Goth. Invest, A.S. kinā — knurr (a in stressed monosyllables, final owing to loss of consonant, is lengthened) O.H.G. knowly (G. wav) (two-). que before consonants results in co (cp. so for sue—soror= $s_{\underline{u}es\bar{o}r}$)— $coqu\bar{o}=quequ\bar{o}$, Gk. $\pi\acute{e}\pi \omega r$ 'ripe' (kueku-); $col\bar{o}=quel\bar{o}$, as above.

The *i* in *linquis* (Gk. $^{2}\lambda \omega \pi \varepsilon_{j}$), and in *sequiso*, afterwards sequere (Gk. $^{2}\omega \varepsilon_{j}$), proves that the change of que into ε_{0} did not precede the weakening of ε into i in unaccented syllables.

quo passes into cu-sequentur into secuntur, quom into cum, equos into ecus; sequuntur, equus, &c. were later formations, due to the analogy of sequitur, equi, &c.

Finally, qu becomes c—nec from neque, ac (for atc) from atque.

Before Prim. L. u and consonants k^y appears as c—arcustem of arcus and arquitenens; insectiones 'narrations' insexit and inseque (also insect, imperative 'tell,' cp. Gk. "brors for inseas, A.S. seegan (eg for gg, by gemination), from segjan). In jean jecinoris, this c also occurs (see above), and in oculus, Gk. "boss (δεχέ), "μμω (δεμω) (oku-). Before orig. i, c also appears—socius and sequor.

The enclitic -pe in nempe, prope, quippe, quispiam, is dialectic for que.

With labial modification, g^u appears in Latin as gu after n— $ungu\bar{u}$ (and $ung\bar{o}$), O.H.G. ancho (G. anche 'butter'); initially, before vowels (except u), and medially, between vowels, as v— $veui\bar{v}$, Gk. βaim (for βaui_u) (gvn-), Goth. kviman, A.S. cuman (=cvoiman, O.H.G. queman (chveman) (G. kommau, bequem 'convenient') (gven-); vivus, as above among typical examples; vvescor (=vvscor), Gk. $\beta bionu$ 'feed', (gvosko); vveh (=vvsto) is quoted by Wharton as belonging to a root gvot-, with which stands in ablaut-relation Goth. kvvipan, A.S. cvovoau (gvot-); viidus (=nvsto)gvot0, Gk. gvot0, Gh.G. undvou0, A.S. undvoau0, O.H.G. undvoau1, undvoau1, undvoau1, undvoau2, A.S. undvoau3, O.H.G. undvoau1, undvoau4, undvoau4, undvoau6, A.S. undvoau6, O.H.G. undvoau6, undvoau6, undvoau7, undvoau8, undvoau9, undv

VCL 03471 410 C541M manic gemination kk, a result that was produced when k (from orig. g) was followed by \underline{i} (and r, l, w)) (nogwot6-). $k\bar{c}s$ is a loan-word from an Oscan dialect; the Latin form would be $m\bar{c}s$.

This v drops after u—fluō=flugvō (hhlngu-), but fluvius (vi= uj); fruor (= frūor, frūgvor), frūx frūgis, Goth. brūks 'uselul,' A.S. brūcan (E. brook) 'enjoy,' O.H.G. brūhhan (G. brunchen) (hhrūgu-).

orunicam) (narugu-).

Before u and a consonant, labialisable g^g appears as g—
gula 'throat' (gull-7), A.S. coole (co=o-umlaut of c), O.H.G.
obila (G. kehle) (guel-); migrō, Gk. danifis (meigu-); giāns
(gul-), p. dajanes (gul-).

fibula 'buckle' = fivibula, from free, form of fige found in Cato (A.S. fifete is borrowed) (dhige), inlor = guïnibr (gnigu); ümeë is for invineë, cp. ii(g)vidus, Gk. vypés (ugu). With labial modification, est appears in Latin as en after

With labial modification, ght appears in Latin as gu after

—achgui: snake' (ghub'), A.S. 3 or (g-i-umlaut of
lengthened u), O.H.G. une (G. mnkr) (nghu-), cp. (r) anguilla

'eel,' and Gk. 'ryg/ne (enghu-); as v between vövels—

nivan, 'snow' (cp. ninguh), Gk. sipa acc. sing. fem.
(mal(n)ghu), Goth. mátivs, A.S. snäw (mä), O.H.G. snäo (G.

ninne) (Teut. snaiyao-) (molghu-); dreviu' s'short' (uneghu-)
sometimes ranked with βrejic's Goth. gamadrigiar s'shorten, A.S. myrge (y=i-umlaut of u)' pleasant' (for induced mean
ing cp. pastimo, O.H.G. nungdüri 'transitory' (mgshu-);

réxis see above.

Initially, and medially, before r, glo appears as f (medially also as b—friō 'rub,' Gk. yfo 'anoint' (ghari,) frunō 'rour,' Gk. ysus(w 'neigh,' A.S. grimm 'fierco,' O.H.G. grimmi (G. grimm) (ghavem-), Goth. gramjan 'make angry' (ghrom-).

These only show traces of labialisation in Latin. Perhaps f is dialectic for g.

Wharton under this head quotes flavus (ghyluos), cp. -Zi.us6;, with different suffix, and fulvus (ghvluos), gilvus (gilbus) helvus, A.S. geolu (ghueluos).

Nebrundines and nefrones have been referred to above. . The velars k("), g("), gh(") without labial modification

are represented in Teutonic by h (and g, by operation of Verner's Law), k and g.

All that has been said under palatals about the representation of gutturals applies to velars. The labial modification, when active, of course sometimes asserts itself, or, it

may be, only colours the result. · As examples of non-labialisable hard yelars take these :-A.S. hčawan 'hew,' O.H.G. houwan (G. hanen), L. cū(dō)

'strike' (kwou-); Goth. weihan 'fight.' A.S. wigend 'warrior' (E. wight 'nimble'), O.H.G. wigant (G. weigand 'warrior') (ueik#-): Goth. nahts. A.S. neaht niht (i = palatal

umlaut of ea, the breaking of ea (orig. o)), O.H.G. naht, Sk. náktis, Gk. víč, L. nox (nokut-). ky, associated with s, remains as k :- Goth, (us)-skaws

'prudent.' A.S. scēawian 'behold' (E. show), O.H.G. scouwon (G. schauen), Gk. (800)oxi(F)oc 'priest' (akwou-), Gk.

zo(F)ίω ' perceive,' (d)zούω, L. caveδ (kRou-). For gy and ghy without labial modification take Goth. kalds. L. gelu, as above: A.S. gealla 'gall,' O.H.G. galla (G. galle), Gk. yoles (ghwol-), L. fel (ghwel-); Goth. bragjan 'run' (Norse prall, E. thrall), O.H.G. drigil 'servant,' Gk.

τρίχω (threghu-, throghu-). With labial modification, ks appears in Teutonic as hw (xy) (and gro (3y), by operation of Verner's Law).

gro before u lost its labial modification, in other surroundings it became u or w.

Examples are :—A.S. Amaint 'cough' (Scotth (kink) host), O.H.G. A(m)nosto (G. husten), Sk. kānsīr 'he coughs'; Goth. kilkwon 'lend', L. limguā, see above; Goth. salkwon 'sen', A.S. sron (ko-contraction of eho), O.H.G. schan (G. schen), G.K. Tongua, L. segpor (suket-); Goth. ahtwo 'water, A.S. ia (achruy) (E. řízhand), O.H.G. aha (G. ane' wasserreiches Wissenland'), L. agua, (akb-); A.S. sēgon (täreon is a new formation) 'we saw,' plu, pret, Treut. sēgon(täreon is a new formation) 'we saw,' plu, pret, Treut. sēgom(tireon) (blub, sinus 'sight' (Teut. sego)yat); Goth. řízva 'arrangement' (Teut. fē(3)yā), A.S. (sepitom (co-a-ho) 'arrange,' O.H.G. (sp)chhū (G. sche' share', G. k. öbra (a 'e-à-no)) (dekta).

There is a new affiliation for Goth. salkwan, viz., to a root

There is a new affiliation for Goth. salhwan, viz., to a root sek* 'sehen lassen, zeigen = sagen' seen in Gk. finer (iners), L. inseque, inquam (insquām), cp. for meaning dicere and distance (Prug. Jour., vol. i. p. 278).

The g, got by operation of Verner's Law, became g, before j in West Germanic. This in High German became kk (see example under palatals, and cf. O.H.G. wulfa, quoted a little below).

hw in Old High German when initial commonly passed into w-O.H.G. hwer, wer 'who'; when medial, the w was lost, as in the combinations kw and gw.

hw before t gives ht—A.S. siht 'sight' (i=i-umlant of ee, but compare the M.E. ee into t before front h(t), O.H.G. siht (G. sicht) (cp. fort, fihit 'cattle,' L. fecup', Goth. salthways. see above. hw also appears as f—Goth. muffs, &c., Gk. holse, (cp. 8); A.S. fowere (iee -contraction for gw), O.H.G. fior (G. vier) (kwekup.), by assimilation from kwetup-(dr.), which gives Gk. rivrage (=n*irreps), L. quatture, Sk. cardstrax, Goth. fisture; Goth. finit (for finiten, second fue.

to assimilation). A.S. ff/f by compensatory lengthening), O.H.G. fn/fnnf) (G.finf), S.k. pánca, G.k. chora, I. quinque quieque (qu by analogy of quattuor, or by assimilation to following qu, the vowel being lengthened before combination non) (manys).

gw must also have appeared as \$\delta\$ (b) (changed into \$\rho\$ in 0)d High German)—O.H.G. nutfpe 'she-wolf' (G. nutfph) (Teut. guffid; coir, guffid; coir,

If Goth. $aug\bar{a}$ 'eye,' A.S. $\bar{a}age$, O.H.G. ouga (G. auge) are to rank with aculus (aku), there must have been contamination between two stems, viz., $a_3(y)$ followed by u, and a(3)y-not so followed, resulting in the combination ags,

With labial modification g* appears in Teutonic as kw—Goth. (astink) kweinrus 'mill-stone,' A.S. coworn (E. quern), O.H.G. kwairua, quirn (gemen). kw before u loses its labial modification—A.S. cumen 'come' p.p., O.H.G. koman (Teut. k(g) wmane); Goth. kaŭrus, Sk. gurás, Gk. βæβε (gwi-h. see above.

g* also appears in Teutonic as ρ (dissimilation caused by g in preceding or following syllable)—Goth. watrpan 'throw,' A.S. weerpan (so = breaking of e), O.H.G. weerfan (G. weerfan) (wergs-).

Kluge says that O.H.G. pflegan (G. pflegen) 'care for' may be connected with βλίφαρον 'eyelid,' βλίσω 'sec' (guleghu-(?)).

The k got from I.E. g^{μ} associated with l, gives result kk, which appears in High German as ah and ah—see typical examples of palatals (see also O.H.G. nachut, quoted as cognate under orig. g^{μ} in Latin).

With labial modification ghe appears in Teutonic as g

before u, elsewhere as w (from 3(u), and (3)u)—A.S. hnigon 'we bowed,' O.H.G. nigun (G. neigen) (Teut. xni3(u)mi); A.S. wearm, see above among typical examples.

After a nasal, give is represented by gra-Goth. siggwant 'sing' (senghu-(?)).

hw (orig. ghs) before t gives ht—Goth. leihts 'light,' Gk. iλ.αχύς, see above.

Sometimes, from local causes, the 3, got from orig. gh? appears in Gothic as x—gaggs (x) 'way' nom., gags (x) acc., A.S. gang, O.H.G. gang, Sk. janghå 'heel-bone' (ghenghu) (non labialisable velar).

generate (going gh?) the first state of generation gg, which in High German shifts to kk—Goth. lagjan 'cause to lie,' A.S.

legan (cg=gg), O.H.G. lecken (G. legen) (leght-) (nonlabialisable yelar).

The labial after-sound in Teutonic seems to have been a full y, since k* and ky have the same representation—Goth. leihveah 'lend,' L. lingué (leik*), and Goth. aihvea-'horse,'

L. equus, Sk. dévas (ékno-).

For orig. kun, gun, and ghun in Teutonic, see Chapter on

For orig. k*n, g*n, and gh*n in Teutonic, see Chapter on Grimm's Law.

There is little doubt that tenues aspiratae existed in the

parent-speech. These may be supposed to have survived, where the Asiatic and European languages exhibit evidence in common—the suffix of the z sing, perf. ind., Sk. véttlen, Gk. vétek (4thu); Sk. sáhdlámi '1 stumble' (ákhvel.), cp. Gk. czóż.)z, ecp[z]o, i ck. vz/z]o, L. színdő (ákhvel(n)d.); Sk. sánkhás 'shell,' Gk. zéryzo 'mussel,' L. zongius 'quant' (konkhe); Sk. nahkás, Gk. (i)mg'(nokhe), L. unguis (mkhe); Gk. vz/zo, 'mun', Goth, braycino (khreghe, khreghe); L. my.

habet, Goth. habdīþ, A.S. hafav, O.H.G. habēt (khabh-). See also on Moulton's Law in Chapter VII.

CHAPTER V.

VOCALIC AND CONSONANTAL AFFECTIONS. ANALOGY.

By way of finishing what has been said on sound-relations in Indo-European, it will be proper to gather together examples, and, where necessary, give definitions of certain sound-processes, many of which have been already exemplified in the preceding chapters.

These will be arranged under the heads of vocalic affections and consonantal affections, each set being further considered under the sub-heads of (1) Change (2) Increase (3) Loss. Vocalic affections first.

CHANGE.

Vowal Assimilation may be regressive or progressive. Convenient examples of the influence of a following vowel on a preceding one are to be seen in the Latin reduplicated perfects didid, momordi (O.L. memordi), pupugi (O.L. pepugi).

Progressive assimilation is seen in elephantus elementum, for eliphantus elimentum. Note also semel for semul.

Assimilation between vowels often occurs when / intervenes. This has been called the 'balancing power of l.'
Notice Sicilia and Siculus, Procilius and Proculus.

The assimilative force exerted by consonants on vowels is sufficiently noticed under each yowel in Chapter II.

Vowel Assimilation is quite a prominent feature in Teutonic.

Umlaut is a variety of regressive assimilation. The change is brought about by the action of the i, u, or a of a following syllable, on the preceding vowel. The causal vowel has not always survived.

With regard to the rumlant the proximate agent in the change would seem to have been the following fronted consonants. These consonants which themselves owed their fronting to a following front-vowel, fronted the preceding back-vowels. The fronting of the consonant has not always remained. It however may still be heard in bridge, A.S. bryg. In this word the fronted g—g is a way of writing gg (from gf), the gemination of g—caused the unitant.

There is no umlaut in Gothic.

(a) i-umlaut is the most original and the most important.

It effects the following changes:—
a (æ) e ü

Prior to the appearance of i-umlaut, the short a in Anglo-Saxon had undergone its changes to a and q.

Examples are :—

(Goth. brigh) byre brican brican (Goth. hilligan) cald dobord to dighter (data.) worogan gold griden (comp.) briden briden briden (comp.) briden briden (comp.) careful (g. sing. pres.) call (g. sing. pres.) call (g. sing. pres.)

(b) u- and o-umlaut effect the following changes:-a, e,

i, into ca, co, io. Examples are cearu (poet.), weorold, siolfur (Goth. silubr).

This welcut is common in Norte but community infraquent

This umlaut is common in Norse but somewhat infrequent

- (c) The change of i to a and n to a, caused by a following a or a, is sometimes called a unlaut. Examples are :— A.S. vaer, L. vir, I.E. yirhs; A.S. natt, O.H.G. natt, I. nidus, I.E. nizds; A.S. dohtor, O.H.G. tohter, Goth. dashtar (dhughw); A.S. hord 'treasure,' O.H.G. hort, Goth. huzd, I.E. kuthdhdu.
- (d) Palatal umlaut is the name given to a change wrought on the εο and iο that have sprung from the breaking of ε before an originally guttural k+consonant. The εο and iο change to iε (i, y). Sometimes εο and ēο are în this way converted into ε and ē before k, x, g, and ε. Examples are reoli and rikt (richt), seex and size (x=kt), ēoge and ēge 'vev.' ēog and ēce' cheek.'

In Modern German, the vowels a_i , a_i , a_i , when subjected to unilaut, appear as $\delta(e)$, δ , δ , a_i as appears as δu (av). The i that caused the unilaut is seen in the O.H.G. forms. Examples are:— $krsf_i$, $krif_i$ (O.H.G. $krsf_i$); at d_i , $\delta liter$ (O.H.G. krli); $\delta liter$ (O.H.G. krli); $\delta liter$ (O.H.G. $\delta liter$), the δr ($\delta liter$) orig, belonging to sing, as well as plu. being utilised as a plu. suffix; $\delta liter$ ($\delta liter$) (O.H.G. $\delta liter$), $\delta liter$ ($\delta liter$), $\delta liter$ ($\delta liter$), $\delta liter$ ($\delta liter$), $\delta liter$), $\delta liter$ ($\delta liter$), $\delta liter$), $\delta liter$ (O.H.G. $\delta liter$). The unilauts of $\delta liter$ and $\delta liter$ are written $\delta liter$ and $\delta liter$ when no connection has to be indicated with forms in $\delta liter$ and $\delta liter$

Rückumlaut, as applied to the alternation of sound in brennen (O.H.G. brannian), brannie (O.H.G. brania), is a misnomer. The a of the preterite is the original vowel, it is the e that is secondary (umlauted from a). Another alternation of vowels (e and t) seen in German is due to the influence of following vowels. This is called Brechung in the grammars. Take as examples these verte, irden (O.H.G. erde, irdin); herde, hirte (O.H.G. herta, hirt). e is original and remained when a followed, but when i followed, it passed to it.

A similar alternation (u and o) is seen in these:—wir

currden, geworden (O.H.G. surrden, geworden); für, vor (O.H.G. furi, fora). u (changed to ü in Old High German when followed by j) is original, and remained when i and v followed, but when a followed, it passed to a. The diphenon in also passed to is (now is) in similar circumstances—G. wir fliegen, M.H.G. fliegen, O.H.G. fliegen, ic has by analogy been driven right through the tense. In earlier German as appeared in some persons (O.H.G. fix).

Breaking is the name given in Angio-Saxon to a change wrought on a preceding vowel by r + consonant, l +consonant, l + consonant (s - k t), or h at the end of a syllable. a in these conditions breaks into at_t , c into c t b, l into l c b. Probably this parasiting is caused by the difficulty in bridging the vocalle space between consonants in different positions. Examples are:—

Goth, arms A.S. carm O.H.G. elaho A.S. colh
Goth, stairra A.S. steorra Goth, ahtán A.S. cahta
Goth, fallan A.S. feallan O.H.G. fehtan A.S. feohtan

The co io got from broken i always appears umlauted to ie. Something like breaking is heard in the American cear for car.

In Gothic before h, hw, and r, i (representing old e and i) was broken to e (written ai). In the same circumstances u (representing old e and u) was broken to e (written aii).

This ai and ai are to be distinguished from the real diphthongs di and du.

The polatal semi-rowel j, and palatal i, g, and sc when initial, produce a similar result, ja and jac becoming gas; ja and jac, g, and gas; while i, g, and ac, change ac, ac, i, into ca, ia, ic. Sievers places these changes under the head of rhatfal influence.

Influence of w. This is the name given to the Anglo-Saxon change of wie (got from wi by breaking, or due to u-and o-unlaw) into ww.—A.S. wwh! (wih!, wh!) 'thing,' O.H.G. wiht; A.S. vondu 'wood' (wiedu, widu), O.H.G. wits; A.S. stward (wword, woo usually remains), O.H.G. wert. The

influence of w is seen at work in the generation of a u in the combinations any, and, and ins. The resultant area, and, time passed regularly into \$\tilde{a}un\$, \$\tilde{c}un\$, \$\tilde{c}un\$, in (nearly always umlatted into \$tev\$ (inv).—A.S. frame ' !ew,' Goth. frawd; A.S. anto 'knee,' gen. antones, O.H.G. chnee, gen. antones, A.S.

niewe niwe, Goth. niujis.

Palatal Influence. See above under Breaking.

Influence of nasals. Teutonic a often appears as (open) ρ in Anglo-Saxon, a-forms however occurring side by side—A.S. monn (mann), O.H.G. mann. This ρ is lengthened

A.S. menn (mann), O.H.G. mann. This o is lengthened when n drops—A.S. gös 'goose,' O.H.G. gans. So ō for Teutonic anχ—A.S. fön 'catch,' O.H.G. fähan, Teut. stem

fanχ. Compare also A.S. ō representing Teut. ō, I.E. ō, before nasals—A.S. mōna 'moon,' Goth. mēna, O.H.G. māno, Gk. μήνη.

Shortening of Long Vowels (not final). In Greck, this takes place before y_1 , f_1 masal, liquid + explosive or spirant — Zele, Sk. dyāds 'sky' j. 80ēc, Sk. gāds j. 8vwe, Sk. dzāds j. dv. dzāds j. dv. pasa, for dr. pasa, fo

iμεγηντ; στόρνῦμε, cp. στρώννῦμε. Long vowels are also shortened before vowels—πέν 'οf ships,' for πε/Γλίν. Compare the so-called transference of quantities in ἐστεῶτες for ἐστεῆτοες, ἐστεῖως and ἰστεῖῶ for ἐστεῆτοες and ἰσταῆτος. Compare also ἐώρων and ἐδγην for ἐγδορων and ἡγῶγην.

In Latin this takes place before <u>i</u>, <u>u</u>, nasal, liquid + explosive or spirant—oloes illis from -ō<u>i</u>s; naufragus (Sk. nātis); claudō from clāuidō (Gk. νλη(F)ie; gaudeō, cp. gāvīsus, Gk. γηθίω for γū̄Fotiω); ventus (uēntos), cp. Gk. āsur-; ars artis (<u>it</u>t). Long vowels are also shortened before vowels—neō 'spin' for nč(i)ō; reī for rčī.

In final syllables also (before t, m, r, l), long vowels were largely shortened in Latin—amet and amēs, equam, Sk. áśzām, clamor and damēris, animal and animālis. A comparison of Jupptiter (voc. used as nom.) and Zvō vārap (auppa and cūpa, littera and litera) brings out a shortening of quantity in the former. The quantity stolen from the vowel was distributed over the time of the consonant's utterance, as is argued by the gemination. The doubling is not always met with, for, in addition to the persistence of the old form, it is probable that this gemination had not the same promunciation as a genuine doubled consonant. Compare the different forms of Mod. Germ. mutter and O.H.G. muoter.

Shortening seems to have taken place in Teutonic before $n + \exp \operatorname{losive}$ or spirant—Goth. winds, A.S. wind, O.H.G. wint, Gk. &(f)nµµ, cp. &irr, L. ventus. It also occurs in Anglo-Saxon in unstressed syllables—scalfan 'anoint,' Goth. salbōn, O.H.G. salbōn (but M.H.G. salbən); in unstressed components of compound words—worolalic, cp. gelic with accent on second syllable, fratewe 'adornment,' tāwe 'equipment Goth. tāwa 'arrangement'; in words where gemina—

tion occurs before r—hinttor 'clear' = hintor, addre 'vein' -& dre, also in combinations where the vowel had been lengthened by compensation for lost n—fraco' infamous,' for fracio, en. Goth, kunhs 'known' O. H.G. and.

Lengthening of Shart Yowela In Greek, compensatory lengthening is frequent enough—xribs(xrafy) by compens. for xriva, phisa(ghafy) by compens for phisa, Ion. you've /yorka' knees, by compens for you've (Attic you've, in Attic F was elided without compensatory lengthening), Hom. addar from &Fes (Attic &Les), vols for vis., vis/ (ios) by compens for ique. The w and the ev of compensation are not real dibthones.

In Latin, all vowels are long before the combinations ns, .nf, gn, gm. Compensatory lengthening also occurs—equôs . for cquons, ačnus for acsnos, nīdus for nicdos, &c.

In Toutonic, compensatory lengthening is met with before n₂—Goth. pālita 'thought,' A.S. 85āte, O.H.G. Itālita, O.I. tongaš 'I know.' See above, under Influence of Nasals. Notice also O.H.G. mēta (also mētu (G. miethė)) 'meed '(e-i, with compensatory lengthening), A.S. mēt,' Goth, mīcās' o'nay.' Ck. metēs.

In Anglo-Saxon, monosyllabic words (ac 'but', g(f')i', ic '1,' be' 'better,' &c.) ending in a single consonant are sometimes lengthened. Vowels are also in this language sometimes found long before the combinations of nasal + consonant. r + consonant. t + consonant.

GROWTH.

Anaptýxis. This is a name given to vowel-generation. When initial it is called Prothesis. Examples in Greek are—

ifulfife, L. ruber; ilappis, O.H G. lungar; Hom. i(f)ifon

'dew' beside fron fron, Sk. verzhât 'rain'; Hom. i(F)theon beside Fitheon; δηντχία, L. mingö. From these examples it will be seen that prothesis occurs in Greek before liquids, F (in Ionic), and nasals. Notice also iρθομικι and βύορκι,

F (in Ionic), and nasals. Notice also ἐρθομαι and ἐδομαι, ὁμόργνῦμι and μόργνῦμι, with and without the prothetic vowel. A vowel is generated in Latin before liquids and nasals,

and usually takes its colouring from the vowel of the succeeding syllable—pāculum from pācum, singulus from semelus, cp. semel, simplex. Loan words exhibit anaptyxis—Tecumēssa (Tixusosa), mina (wā), drachuma (baryas).

In Teutonic, Goth. milnhs, A.S. meoles, O.H.G. milnh (Gh. (a)µi1/yı) (medig.), cp. L. mulgeë (mlg.), seem to exhibit anaptyxis. Other examples (in West Germanic) are A.S. her(h/ge 'to the army,' O.H.G. herige (between r and f), cp. Goth. hhrma (Gh. bēzis, St. dashshina' 'right, south'); O.H.G. wahsamo 'growth' (between cons. and yp. Goth. tathkuwa (Gk. bēzis, St. dashshina' 'right, south'); O.H.G. wahsamo 'growth' (between cons. and nasa), beside wahsma, tevaham (G. wachsen 'grow'). Goth. wohlpan, A.S. weexam (uskus.), Gk. ušśńni (usa.)

Epenthesis. This is an accompaniment of the Palatalisation and the Labialisation of consonants, effects that are produced by a post-consonantal if or y. The palatalisation and labialisation echo back into, and finally become wholly located in, the preceding syllable, converting any vowel other than i or w into an i or w diphthong—cube for pariy i jägdøns for aspija, cp. depus jöisenus for desevrie; a alyusi point of a spear for dynija (gyz.), cp. 1770s; Holm. vri o (rows) for resig. Sk. daya; rubes (rusp's) 'bull,' beside Gaulish darwo (Kirways; is for Krebays, by popular etymo-

logy from x serie 'goad' and rabjes, = Sk. gandharvas 'demi-

gods inhabiting Indra's heaven '(?)).

T.OSS

Ontraction. In consequence of the disappearance of $I_{p,q}(F)$, and s between vowels, contraction is common in Greek. The hiatus resulting from the loss of these letters is often closed by this means— $g_{p,q}$ contrd. from $g_{p,q}$ ($g_{p,q}(g_{p,q})$), $g_{p,q}$ from $r_{q,q}$ ($g_{p,q}(g_{p,q})$), $g_{p,q}$ from $r_{q,q}$ ($g_{p,q}(g_{p,q})$), $g_{p,q}$ from $r_{q,q}$ ($g_{p,q}(g_{p,q})$), which passes into $g_{p,q}(g_{p,q})$. The contraction of s and $g_{p,q}(g_{p,q})$ passes into $g_{p,q}(g_{p,q})$. The contraction of s and $g_{p,q}(g_{p,q})$ for $g_{p,q}(g_{p,q})$. Hence, $g_{p,q}(g_{p,q})$ for $g_{p,q}(g_{p,q})$ for $g_{p,q}(g_{p,q})$ for $g_{p,q}(g_{p,q})$. Hence, $g_{p,q}(g_{p,q})$ for $g_{p,q}(g_{p,q})$ for $g_{p,q}(g_{p,q})$ for $g_{p,q}(g_{p,q})$ from $g_{p,q}(g_{p,q}$

This s and so are naturally not real diphthongs, but graphic expedients. If the wowles to be contracted are of different qualities, at times the equality of the first prevails—fixer for sixen (&Fruse), 'Arquida for 'Arquida,' Dor, ra's gen. plu. ferm. for ra'en, op. St. thism, I. tristirum; 'Ardrews for e-(4)*1, op. L. majörs*2 (the * coloured the * into *, and the resultant as then passed into w): at times the quality of the second—Attle ra's gen. plu. fem., op. Dor. ra's above. In yives for yirs*s (yrsess), the * fell to *, under the attraction of the *, and the resultant as passed into w. If the second of the vowels to be contracted was * or *n, various apparent diphthongs resulted—axis* (ru(F)*s), *is* (\(\bar{V}(F)*s), * u(i*s), \(\text{daw}\), \$\daw{s}* (thick', (for beavise, \(\text{c}), \text{daw}s) = \text{daw}s.

Elision is a species of contraction. The Attic is the

dialect that has most persistently weeded out uncontracted forms.

In Latin the loss of medial \underline{i} is the most frequent cause

of contraction—trèx for trejes monête for mone(tjete, stò from stál(j), stat from stál(j), amês for amiljös (1.E. -jeis). Contraction does not take place in Jatin with the combinations of of and ale-mones, monaim, aënus. The loss of h also gives scope for contraction—nëmé for nehemê, himus for tehinus, praches for prache nehemê, kimus for tehinus, praches for prache. Not toe ergê for congó, dégé for déagé, primé for pracmê. (Wharton derives prêmê civici, ècc., from words made up of prepositions and adicettival endings, en prêms: cellajere.) But écête.

remains uncontracted, as happens when the second vowel

is long, and has the principal accent.

For a common example of contraction in Teutonic, take (ioth. fiit' sate up' 3 sing. pret., A.S. frit, O.H.G. frit, rett. friti, contrd. from fra-ti, as is seen from Goth. pres. frailum 'eat up' (E. fret, G. fressen).

Certain Anglo-Saxon contractions claim notice. The result $\tilde{\alpha}_i$ is given by the West Germanic a + a, u; \tilde{a}' (Teut. $\tilde{a}') + a$, u. Examples are silan' slay," Goth. sinhau; sinh

The result $\tilde{c}o$ (io) is given by West Germanic c+a, a, u; i, i+a, a, a, v; i, i+a, \tilde{a} . Examples are $\tilde{c}ow = sch(w) o s.$ (6th. saihwoan; $\tilde{t}ow ^*$ consure, O.H.G. zihan, Gh, $\tilde{c}oh\tilde{c}_i \tilde{c}v$; $h\tilde{c}oh^*$ 'promise' for $h\tilde{t}(h)\tilde{c}ih$ $th(h)\tilde{c}ih$, O.H.G. $hhh\tilde{c}ih$; and friv 'free' for frija, Goth. frish (acc. sing. m, frijan2) Sk. frijah

'dear.' A following vowel after any co is crushed outteon 'draw' for teu(h)on, O.H.G. siohan (G. siehen), O.L. doucō.

A.S. \bar{a} (Teut. \bar{a}) + vowel = \bar{a} — $t\bar{a}$ 'toe' = $t\bar{a}he$, O.H.G.

zēha (G. zehe), I.E. daiku-. A.S. $\ddot{o} + a$, o, u, $e = \ddot{o} = h\ddot{o}n$ 'hang.' Goth, and O.H.G.

hahan, Teut. yany., I.E. kanku., Aphaeresis, Syncope, and Apocope are names given to different kinds of vowel-loss, according as this manifests

itself initially before consonants, medially between consonants, and finally after consonants. That vowel-loss which leaves a syllabic something behind it, is called sambrasarana (the term of the Sanskrit grammars), e.g., fic

is the samprasāraņa form of rt. vac. Vowel-loss existed in the parent speech. . ~ In Latin take the following examples: -sum (esmi or

esm) due to the analogy of sumus; ager from agrs, samprasarana of agres, agellus for agerlus (agrolos), cette 'give ye' from cé-dite, valde (cp. validus), nuntius for noventios, audeo (cp. avidus); hospes from hostpes (hos-

tipes), princeps from primiceps, Pollix from Polulices (Gk. Πολυδιύκης), nuper for noviper, sinciput (sēmi-, caput), sēsqui- (sēmissi-, que), sēlībra (sēmi-, lībra), sēstertius for semistertius, Marper for Marci puer, prorsus for proversus,

(sī,- ne pronominal, as is the n of alioquin), stremps and

meopte (cp. utpote), dodrans (do. by-form of de, and quadrans) surgo (sub-, rego), repputi (ré-peputi), dic, duc, &c., beside older dice, duce, &c., tot for tote toti (cp. totidem), et (cp. Gk. ivi), exemplar and exemplare, volup 'agreeably 'and volupe (cp. Gk. Thru), famul and famulus, new and neve, ac and atque, quin 'but that' (qui (abl.), ne negative), sin 'but if' siren he 'similarly' (got from the collocation st rem complet—, Wharton says it is a perf. inf. of a surimo 'take up,' so that siren he ke esto quasi means 'let an assumption he law as though—'t.

For these remarks on quin and sin confer Brugmann's lournal, vol. ii., pages 212 and 222.

In Teutonic, take the following examples—A.S. biscop, O.H.G. biscof (G. bischof), from Gk. iciocom;; Goth. ctulfs (Teut. wulfaz): Goth. satja 'I set' (Teut. satjië).

In West Germanic the following rules hold in regard to syncope:—Short vowels drop out in open syllables (a) after long syllables bearing the chief accent; (b) after a syllable bearing a secondary accent, following that (long or short) with the chief accent—A.S. hirrde (ir – umlaut of ēa, Teut. an), O.H.G. hörta 'heard' for hörtla, ep. Goth. kduxida, O.S. mahigro from militative dat. sing, fem. of mahigmights,'

The second head will now be taken up, viz., Consonantal Affections, divided out into various sub-heads.

CHANGE.

Assimilation. Examples in Greek are 1612, cp. 1641; 1276 61.7; (1274); icogususfis (1474) 'with seven halves'; 146369; (146474) 'secretly.'

In Latin, these will serve: --perare: -preduce (pix petit); hor = holde; agger (ad, gerd); ampulla (amporta) bottle; cp. amphona; polliceri (por, liceri); tollie tolin; sollue solros, Gk. eines, Sk. sdrvas; omnis for opinis (cp. oper, or is it ob? Bréal calls omnes a doublet of homines); gener (server servers, Gk. vandes; Gk. va

(O.H.G. higheaut); G. himbers 'raspberry,' for himbers' berry caten by the hind' (O.H.G. himbers', Somither 'specific considerate (O.H.G. himbers); G. minper 'spelash', for neinderate (O.H.G. minbrimes) delia sich windende Braue'); G. hoffart 'haughtiness,' for hochfahrt (A.H.G. himbers 'andet,' for inbits (minbrisen).

(A.H.G. himbers 'analet,' for inbits (minbrisen).

In Latin, these may serve:—gurguliö 'gullet,' cp. Gk.
yuyyuşısı'n; singularis and pluralis; piādum (-do-) and lucrum;
caucer for career, cp. Gk. zuşıshoe; agrestis for artestris, cp.
silvestris; crobexes and crobrexes; antestāri for antestatīr;
truddare for trucicidare; sāmāstris for sāmimāstris; stīpendium
for stippendium; nūtrīz for nūtrītris; viluperāre for vilituberāre.

One or two examples for Teutonic may be given— O.H.G. marmul (G. marmel) from L. marmer; O.H.G. turillible (G. turtellaube, E. turtle) from L. turtur; Goth: awaitr 'sheep fold,' for awiwistr, A.S. čowestre, O.H.G.; gwist.

Assibilation. This is a name given to the conversion of a dental to s. The following examples from Greek will serve:

—des (cp. L_polity); &-r.des 'double,' cp. drawre, Goth.

falps, A.S. feald, O.H.G. falt; & (cp. L. til); wipes (Dor.

πίρυτι) 'last year,' cp. Goth. fairneis 'old,' A.S. fyra, O.H.G. frni (G. firn 'vorjährig').

Labialism was the name given to the passage of the velar guttural into τ , β , ϕ . See Chapter IV., under velars.

Dentalism was the name given to the passage of the velar guttural into r, à & See Chapter IV., under velars,

Rhotacism is a name given to the change of s into r (see Chapter VII., under Verney's Law and Conway's Law) or to the appearance of r for A.

Labdacism is a name given to the change of r into ℓ .

Voicing. Examples are L. gubernō borrowed from Gk. rollston, Burrus borrowed from Gk. Itōjis; (see Chap VII., p. 171); L. augulus, cp. aneus; L. singulus (senklot); L. viçinti for vicint, on the analogy of septingent, where the ge is said to be original (palatal g); L. Agrigentum (Gk. Azsáyas); quadra 'square,' for quadra; L. ab, ob, sub (cp. (kk. &ra, ird., ira).

Unveleing. Examples are L. amures 'oil-lees', borrowed from Gk. ἀωίερη; L. ερθιαια, borrowed from Gk. ετέλουξ; cirnu, another form of advus, borrowed from είδιος', fertica 'pole,' for fertiga, from fertings'; aput and haut beside apud and haut.

Metathesis. Examples of this common interchange of letters are Git. saylika and spesith, E. worst, I.A.S. weeks and warst, L. verse); E. ask (A.S. dacion and diction); E. bright, A.S. borsht and broth; O.H.G. Spill (G. csrig (g for th in unaccented spillshe), A.S. acad (for d ep. abbod from abbiton), 'aus afik für atiba,' got from L. acitum by transposition.

GROWTH.

Reduplication. Examples in Greek are these:—Ordinary reduplicated perfects; Γστρια (ασσίακα); Γρτρια (ΕνΓριανα); εξυμανα (ασφίακα); εξυμανα (ασφίακα); εξυμανα (εξυριανα); εξυμανα (εξυρι

From Latin take their—the ordinary perfect of reduplication, e.g., phoponal for speepond; sidi (seed, seed), setal for stesis, sedd for seteld, that for tental, repper to repeper; gegat; querquerus 'ahivering cold,' murmur (Gh. nopudpa), quisquillae 'droppings of trees' (Kr. nostu, dental).

Aspiration. Take as example these:—āōŋ 'to excess,' due to influence of āλr, ēṣraḥ 'saping,' due to influence of ἀρπ' sickle'; infa, due to influence of iξ and irra'; [auρs; from root vr. 'wish' not tuh. (Darbishire, Spiritus Asper); λumerus, cp. Gk. δμας.

Gemination. This is a name given to the doubling of a -consonant; sometimes in certain manifestations the name Affrication is given. Examples are common. Gemination often occurs in West German before £—A.S. hibban (Goth. hafjan), A.S. legam (Goth. lagian). Many examples have already appeared.

Epanthesis is the name given to the insertion of a consonant. Examples are ἄνδρα, μισημβρία (ἡμίρᾶ), μίμβλωνα

(cp. ἔμολοι), ἄμβροτος (cp. L. morior); exemplum, templum, compsi; thunder, nightingule, humble (Λ.S. δunor, nihtegale, L. humilis).

Epithesis is the name given to the addition of a consonant. Examples are lamb, tyrant, land, middt, thumb, sound (A.S. lant)b, Gt. vipanes, A.S. länan, A.S. midde, with gen. suffix and excrescent t, cp. whilst, amongst, A.S. vänan, M.E. sown). Note, with suffixed d, G. trgend – O.H.G. tergen, w. (G. je) wyrgin (A.S. kwergen 'anywhere') (gin = Goth. -lun, L. -anone).

T.ORR.

Desspiration. Take as examples of the lifting of the aspirate these "σίδας dialectical, L. solive; flowed dissimilated by θ; δτιγ "without," cp. Goth. sundrē, A.S. sundor (E. sunder), O.H.G. sunder (G. sondern, besondern), with which some connect δτιγ, O.H.G. δτιν (G. o.htr); ξέγα (ψ-ρ-ωγα) dissimilated by ρ; ifθε; by dissimilation; iξεη (έξι. verxds) by influence of anaptycie (ψ-βγεη; εδινία for δτινά (Sk. sun 'accomplish') (due to dissimilation effected in the second person sing, of the present where δείκαι became δτιλια, or to the influence of the Greek representative (seen in δεμικες for ξεφιμικα) of Sk. sun 'desire, obtain') (Darbishire, Spiritus Asper); iδικ and iσκ, which come from different roots that have got mixed, cp. Sk. sdnae (snyds, Gk. ins), L. senex, Goth. sineigs 'old,' E. syne; primus for prehisuss.

Aphaeresis. Examples are cōntōere (cōgntōere); sub, super, cp. Ck. tgʻorepis; Idius for tidatus; lac (Gk. yakas); status (cc. cōgnātus); suōscō (cp. c̄gnācus); narrō (cp. ignārus); līgutritia (Gk. yakas); stous (A.S. cubi;) veutō (Goth. kuviman); Jūpiter and Diespiţer; Jānus and Diāna; lacua

from Gk. χλαδα, by influence of lāna which has lost a v (cp. selfus); figő (Gk. eriyu); pānuc (spāma); fungus from elypyrs; in arotā (O.H.G. surezeu (G. schmerzeu)); nix - (Goth. sudiau); langueō (A.S. slare 'slow'). Note also E. leaf, clad, rawen, lisp, root (A.S. slaff, Chaucer's yelad, A.S. hrafin, A.S. suisp adj., A.S. svorātan); pāma for quantë; plas

Ecthlipsis. Convenient examples of the crushing-out of consonants are furnished by the Anglo-Saxon dropping of d, 5, s, and st before verbal st. See also under Contraction.

for eura.

Apocopa. Examples are γάλα (γάλακτε), διεγε(τ), όδτο(δ), καλδε = καλαδ (the ε fis such words is due to the retention of the ε that had been generated from the δ in certain conditions of the sentence-life of the word), lac (lactit), cor · (cordit), as (casis), far._(farrit), mel (mellit), pracddd(s), canidd.), meridd. herildd.

Many general examples are scattered up and down in Chaps. II., III., and IV. Many examples of English sound-

Chaps. 11., 111., and IV. Many examples of English soundprocesses are to be met with in Chaps. VIII. and IX.

It will be necessary to give a little space to a notice of the

laws for finals in Teutonie (Auslautsgesetze).

Notice the following facts concerning finals in Primitive

Teutonic:—

7. Final *m* became *n*. This when protected by a particle remained:—Goth. bana, but otherwise, as did original *n*,

temanted—Coth. pana, our otherwise, as the original n, dropped after short vowels—Goth. zoulf (a), Gk. λύπεν, L. lupun.

After long vowels the nasal lost quantity, dropping off

After long vowels the nasal lost quantity, dropping of afterwards in the individual languages.

Goth. taihun 'ten,' sibun 'seven' retain their final n owing to the influence of the ordinals taihunda, *sibunda.

owing to the immuence of the oximinal statustical, stientifical, and d dropped off—Goth. hima (L. quod), Goth. börum (börum)), 3. Original eff. fig. became est, est—Goth. ghósí 'to a girl,' cp. Gk. χώφε for χωνδι, Goth. ahádu 'eight' (októn), anstái 'to a favour' 't'anstái loc., cp. Gk. eskri).

Otherwise the endings in Teutonic were full endings.

The following laws about finals hold in Gothic:

1. Long vowels that were originally final, or had become final in Primitive Teutonic, were shortened in polysyllabic words—Goth. juka 'yokes' (Sk. jugā, O.L. jugā), Goth. baira 'I bear' (Gk. pipa), Goth. hvanuma 'to whom,' cp. hvanumāk' it overv one.'

Long vowels remained in monsyllables, and in words that originally ended in nasals—Goth. bō acc. sing. fem., Dor. rh, Goth. hairtō nom. sing. 'heart' (*hertōn).

2. Short vowels, excepting u, that were originally final, or had become final in Primitive Teutonic, dropped off. This law applies to the final syllables of polysyllablic words that ended in a single consonant, unless that were consonantal f

or u. Examples are Goth. wdit 'I know' and 'he knows' (Gk. dōa and dōa), Goth. df' from' (Gk. dɛɔ), Goth. bdrrl' (Sk. bbdrath, Goth. wwlfs (Gk. bɔzo); but filu 'much' (Gk. bob). The law is inconcrative in the case of original mono-

syllables—Goth. is 'he' (L. is), Goth. hwa 'what' (L. quod).

3 Short and original final ai and oi became a in polysyllables—Goth. bdirada' he is borne' (Gk. çiştru), daga'
'to a day' (dhoghwol loc).

Of consonants the only primitive final kept in Gothic was s. The only primitive consonant-group that remained finally was ns.

The following are the laws relating to West Germanic :

r. Final long vowels coming down from Primitive Teutonic were shortened in West Germanic—O.H.G. birn, A.S. bere (in West Saxon the optative termination e displaced et, note Mercian bears, North. bero (Gk. pips)); belonging to the ā-doclension A.S. girfu, (O.H.G. geba is

belonging to the ā-declension A.S. zirfu, (O.H.G. geba is the acc. form), cp. Goth. giba (in Gothic orig. -ā and -ō, 'when shortened, came to a, and not u, as in other Teutonic languages); O.H.G. riri (*rizi) imp. subj. 3 sing. of risan 'fall' 2. After this law, there operated the law of syncope

referred to above, by which the short vowels of dissyllables, when final, or followed by one consonant, dropped off if the first syllable were long. This dropping off also took place in polysyllables with a secondary accent on the penult. Examples are A.S. wwif voc., O.H.G. woif from "mulfs" "wulfe (Gk. 1/ws); "A.S. wwif nom., O.H.G. woif;

from *wnifax (Gk. 1.kse.); O.H.G. irdin (G. irden) (*irpinaz),
A.S. bireo, O.H.G. birit (*birid). Note with short first
syllable these:—O.H.G. film (L. pea), A.S. wini 'friend,'
O.H.G. wini (*winiz). Levelling sometimes furnishes
seeming exceptions, e.g., A.S. ber 'bear' imperat, O.H.G.

δir (Gk. φiρ). These took after imperatives that dropped the vowel according to rule.
3. There was a later shortening of long vowels occurring in polysyllabic words that had dropped -n or -s after the long vowel; in -ē and -ē from the -ai and -au that were either already final in Primitive Teutonic, or had become so by loss of -z; and in the z that came from -ii. Examples are A.S. hana *cock,* O.H.G. hano (Teut. yanōn); A.S. menigu (the -u taken over from the ā-declension), O.H.G. managi (Teut. managin); A.S. dags, O.H.G. iage (*dagsi loc. as dat.), O.H.G. abi, C. A. cahāt *eight, O.H.G. abid (októn); O.H.G. noii 't 'thou wilt' (*wiliz orig. optative of a verb in -mi); O.H.G. getti nom. plu, from *5astīz *5astījiz, cp. Coth. gatto,*

Final -z dropped off in West Germanic, -s remained, but had in many cases been supplanted by -z. See Chap III., under s.

When by the action of the laws for finals a nasal or a liquid (preceded by a mute) lost the succeeding vowel, it became vocalic, acquiring syllable power; in West Germanic a vowel was often generated —Goth. akrs figtl, A.S. acer figel, O.H.G. ackar figtl. In such a position consonantal i or w became of course vocalic—Goth. his i 'come here,' old imperat, for hirji (2 plu. hirji') 'come ye here').

These remarks, supplementing incidental remarks made in Chaps. II., III., and IV., must suffice.

This seems the place to speak of the action of that important agent in sound-change called Analogy.

In Chaps. II.-IV. have appeared numerous illustrations of the reign of Phonetic Law.

These two principles are the prime solvents in matters phonological, and account between them for the form of all the native words in a language.

In dealing with foreign words the effect of their own proper phonetic laws has to be discounted. Owing to the intimate inter-relations of Phonetic Law and Analogy, the second remodelling the work of the first, and toning down the diversity produced by its action, a clear conception of the scope and action of the one involves something similar regarding the other.

Phonetic Law is correctly, if somewhat grandiosely, defined by the now well-known shibboleth 'Phonetic Lawn have universal validity' (Allgemeinglitigkeit). This truth is not empirically demonstrable by proof got from any random examples blindly chosen, but only deductively necessary by consideration of what is causal and initial in sound-processes. Sound-change as a rational process on large lines, and as the organic agent its results show it to be, does not begin with a few words, and get extended to others, but is due to the jinduced action of the pronouncing organs, which, supplying the accomplishing impetus, will in every word similarly mould the same sound every time it is acted on in the given circumstances.

It cannot then happen that a sound-change will take place in certain case, and in-certain other similar cases not take place. Die Laufgestes wirken blind, mit blinder Nohwendigheit (Osthoff). Two different results cannot (unless as different stages of development) be referred as descendants to one sound-group.

The possible doppelformen must bear the relation of mutterformen and techterformen. Schwesterformen are inadmissible. For instance parties and parties; cannot both be derivatives from a form parties; comes regularly from parties; (St. málityazas), while parties; is an associationabildung, getting its s'rom parties.

Within a prescribed area (and in the case of individual

laws, it may be, a prescribed period), phonetic law is absolute and admits of no exceptions. That area is the one in which the phonetic material to be reasoned on has accumulated.

Not that here all is explicable. After everything that comes under the head of analogical change has been allowed for, after everything foreign, every distatutioning has been discounted, even after observation has been confined to the average speech, there remains much that is inexplicable. Part of this inexplicability is due to the fact that before we can discern the action of laws we must know them, and we cannot be said to know all the laws that have wrought on phonetic material. All this has to be admitted, but let not therefore spondic change (Lautvertretung) be ranked as a solvent.

As an instrument in practical research, Phonetic Law suggests lines of investigation, supplies tests of truth, and warms us off impossible tracks.

If one considers the large mass of regular phonetic change, there is nothing for it but to assume the working of regular phonetic law. Its adoption as a working hypothesis has begotten methodic research, has led to scrupulous accuracy, and has stamped out narrow generalisations. Its positive results are many, and of much moment. All through these chanters there appear proofs of this.

Analogy, as distinguished from Phonetic Law, is a constructive force. It introduces method; it fixes bounds; it sorts the stuff that phonetic law disarranges; it reduces useless isolation; it seeks for harmony; it forms proportions; it runs series. Grouping and system argue its presence, ungrouped and straggling forms are likely, when interpreted, to furnish illustrations of the working of phonetic law.

Analogy is the psychological factor in language. Phonetic Law is the physiological. The latter is a pioneering force. partly creative, partly destructive, the former, a reserve force, auxiliar and architectonic,

Analogical action in a particular direction is never necesary. Its detection depends on individual skill, and is not a consequence of its a priori presence.

An analogical formation does not oust the old formation. The two may long co-exist.

Analogical explanations are to be submitted to subjective tests, any conviction they may carry with them is external, and Lased on the number of parallel instances.

Phonetic Law and Analogy complement one another. .The more strictly we stand by the one, the more frequently have we to bring in the other.

Examples of the working of analogy will close this chapter.

These may conveniently be classified under the heads (1) Meaning into Form; (2) Form into Meaning; (3) Form into Function: (4) Function into Form.

Likeness in meaning or kind has led to approximation in form; likeness in form, to misapprehension or misplacement of the meaning of the name, or to misapplication of significant elements; and likeness in function, to transference of formal and functional elements:

Head (2) furnishes examples of what is called popular etymology (Volksetymologie).

MEANING INTO FORM.

Some of the most common instances of the workings of

analogy on these lines are seen in certain result, produced by levelling.

These appear (1) in Nouns and Adjectives, and are caused by the influence of case on case: - Gk, tides, viger, vibra, creei for the regular (with weak grade) forms tion, trees, tider (Ionic), prasi (a - y) (Pindar), by influence of the other cases, ep. also apain for acon (a - n). with a from other cases: In honor and arter for honos and artes, by influence of the r of oblique cases, patres, &c., with an e got from influence of ores, &c. (oresevels - everes); vellow (A.S. veoln), shadow (A.S. secodn). also shade-these words get to from the oblique cases; G. rauk (M.H.G. rück rühes), &c.-in such words the & of inlant has generally supplanted the ck of auslant, but we have still such contrasts as kock köker: (2) in Verbs, and are caused by the influence of person on person, number on number, and case on case :- (ik. 7:7)/24 (cp. rirkeza), due to the cof there, &c.; & it and draw." used as participles: Fr. reis votons for rois viens (L. vides vidirus); G. fliege fliegst fliegt for fliege flengst flengt; G. . schnitt schnitten for O.H.G. sneid snitum: (3) in Derivatives. and are caused by the influence of primitives: -leaface for learner, by influence of leaf; G. antwort (M.H.G. antworte), a reformate after swort: Ital, normata for neganta, by influence of novem.

The influence noticed under the last head is sometimes reversed:—Lesb. $\sigma_{i,k+1}$ after $\sigma_{i,k+1}$ $\sigma_{i,k+1}$ with sound heard in $\rho_{i,k+1}$ $\rho_{i,k+1}$, instead of the usual name-sound of σ_{i} , though the normal influence between primitive and derivative is also evidenced by the other pronunciation of $\rho_{i,k+1}$ ρ_{i The changes produced by etymologising may be brought under the head of levelling—fault (M.E. fault), by accommoddation to fallere, throne (M.E. trone), by accommodation to "25/162.

Related meanings lead to approximation or contamination in form. Examples are Sk. ndpātam ndgtrā (for ndptā), after pidram pitrā, &c.; Sk. ūzsav with a from the numbers with zavra; Gk. rpirars; modelled on īzava šiszava; Gk. iguau with apirate from association with t@qua sit perfect; Gk. ipuō with t- from the rom. iyū (cp. Mod. Gk. isū); Fr. iten sien (O.Fr. tuen suen) by analogy of mien (O.Fr. niva).

For an example of contamination take *itineris* gen. of *iter*, due to the mixing of two genitives *iteris* and *itinis*; O.H.1. *i. iim* (G. bin) produced by the mixing of the products of two roots, vin., bhey- and er., cp. A.S. beon and Goth. iii.

Formal characteristics are often due to association in meaning. Thus the Greek nouns of the second declension ending in +ε, and meaning "way," assume the gender of δόξ; names of towns assume the gender of ατλοτ; Latin names of trees take on the gender of ατλοτ; hunns takes on that of terra; Fr. tlf masc. (L. aestatem fem.) goes over to the gender of the other seasons hiver, printemps.

The relation that subsists between congeneric words often leads to an adaptation of form to form. Examples are Gl. Excels. with a from cyterio; Gk. μαρείν with a from cyterio; Gk. iματός (Rolic ἄμμες) with aspirate from iμετίς (Sk. base yushmad); L. growis, which assumed in Vulgar Latin the vowel of levis, whence Ital. greve; female (M.B. femele, O.Fr. femile) by influence

of male; neither (A.S. nonder, Prov.E. nother, E. nor), by association with either (A.S. agoer).

I may here give one or two examples taken from Bloomfield's most suggestive article 'On adaptation of suffixes in congeneric classes of substantives' in the American Journal of Philology, Vol. XII. 1., from which I have borrowed the words 'concentric' and 'adaptation'.

In this article he gives good reasons for attributing the form of rois; to the inflnence of tions, both denoting parts of the body; for attributing the n-inflection of Goth, films to the action of handsas, which has the n-inflection in Teutonic, though probably this was not the original inflection. The impulse towards the n-inflection was first given by hinnus 'chin, check,' an original n-stem (St. hhnus 'jaw,' Ke, Trius' jaw, 'L. gennium' belonging to the jaw?). There first ensued a rapprochament between the declensions of 'kinus, and of the stem hands', this being furthered by the presence in the latter of the quasi-s-forms that represented original m and n, vix, acc. sing, hands(m), dat, plu, handsum), acc plu, handsum.

These two words, the one originally, the other secondarily, of the n-declension, then influenced the congeneric nouns with which they must have been often paired, handus

dominating folus, and kinnus, tunpus.

In the same article he speaks of the t of Coth, havilla's

'white' (kucikis) as perhaps due to the influence of the congeneric seartes (suordes).

He attributes also the extensive employment of stems in rand n—Cik z̄rap z̄rams; (ar = gr), L. fɛmr fɛminris; sidney claves; (ar = gr); L. fɛmur fɛminis; L. accīpiter (cp. Gk. iazb;, rrapis; popularly connected with accīpii) and fɛmin

(pctna); &c.—to the exertion of analogical influence by a few nouns.

Similarly the appropriation of the suffix ~zo, ~z, by certain Greeic class-names (birds, animals, plants)—//zaff cowl, ~zizzf cuckov) &c; zif (goat, doi.zaf) fox, ~zizzf freed, &c; zizzf freed, &c; zizzf freed, plants freed, p

FORM INTO MEANING.

An alteration of form usually goes with the new or perverted meaning read into the old form.

Examples are incentive (incinere 'to give the note') associated with derivatives of incendere and so misused: cullet (Fr. obtelette (L. costa)) associated with cut: G. wahnsinn (cp. E. wanhope, wanton) from adi, wan 'empty 'associated on the disappearance of this word with the noun wake 'delusion'; Gk, 'Ιεροσόλυμα 'Jerusalem' owing its form to association with isses: E. belfry (O.Fr. berfroi, M.H.G. bercorit 'watch tower' (cp. G. bergen protect and friede 'peace')) got from association with bell: E. crayfish (M.E. crevis. O.Fr. escrevisse, crevisse) got from accommodation to fish; E. causeway (O.Fr. caucie, L.L. calciata (via)) by accommodation to way: E. mystery(-plays), acted by craftsmen (O.Fr. mestier, L. ministerium), from association with mystery (Gk. µverfprov); G. eiland (M.H.G. eilant 'solitary land') associated with (ei 'egg' and) land; echt 'real' (M.H.G. ēhaft, ē (G, ehe) 'law') commonly associated with achten 'value,' and written ächt: G. sündflut 'deluge' (O.H.G. sin-vlust 'great flood,' cp. G. singrun, Goth, singles, E. syne) got from association with sunde 'sin'; G. maulwurf 'mole'

(M.H.G. moltwerf 'mould thrower,' cp. Shakspeare's moldwarp, Sc. moudiewart) a 'volksetymologische Umbildung' on mau!' mouth'

FORM INTO PUNCTION.

Certain common endings have been generalised. They have ousted strange endings that bore more or less resemblance to themselves. For example, pleasure (O.Fr. tarisir) has fallen with measure, nature; tardy (O.Fr. tarisir) has taken after grilly, measy; surgary (O.Fr. tarisir) has taken after grilly, measy; surgary (O.Fr. tarisir) has cocepted the yoke of sorcery, thineury, see, sausage (O.Fr. saucisce) has gone over to courage, usage, &cc.; yillable (O.Fr. tillabe) has put on the ending of parable, constable, &cc.; and reprimend (L. (rs) reprinende) has been accommodated to command, demand.

Just so with prefixes. The aggressive n of the new contingent of Latin words has replaced its descendant in inspire. and intend, &c., and threatens to do so in words like inquire.

Notice too, how in recount, repeal, refine, re- has regained living fulness, and in its re-growth, cramped out of existence the a (L. ad) of the Old French originals remotter, repeirs, raffiner. Advantage (M.E. avauntage, O.Ft. avantage (at, ante)) bears witness to the assertiveness of ad. So too with the related advance.

PUNCTION INTO FORM.

A transference of elements is seen in Sunparay for the regular Zunparay in the imposition of the endings of statem on \(\lambda{u}m\), an setem (cp. L. \(\lambda{e}\) (boileris); in the extension of the genitive ending \(\text{-s}\), in English and German, beyond its

former sphere—E. lady's maid and lady-day, G. des vaters and M.H.G. des vater, G. liebesschmerz, where the s is due to analogy and not to atavism (in Gothic the gen. fem. exhibits s); in the encroachments of umlaut, in German, into other than i-stems—G. töchter and O.H.G. tohter; in the extension of the long vowel proper to the subjunctive of thematic verbs to non-thematic verbs—non-thematic "ωμεν (Homeric "ομεν); in the assumption of the augment by $\chi \rho \hat{\eta} \nu = \chi \rho \hat{\eta}$ noun, $\hat{\eta} \nu$; in the appearance, in $\pi \epsilon \nu \tau \hat{\alpha} \pi \delta \nu \epsilon$ and έξάπους, of α, which had apparently acquired a sort of functional value from its occurrence in cpds. of ἐπτά, δέκα, ἐννέα; in -nist for -ist in tobacconist, from influence of pianist, machinist, &c., in the -tism of egotism (cp. egoism); in the generalisation of the verbal -igen, properly belonging to adjectives in -ig, evidenced by its appearance in reinigen, huldigen, befriedigen.

Some of the examples appearing under this and other heads might be given as examples of what is called proportional analogy— $\sum \omega z \rho \alpha \tau \eta s$: $\sum \omega z \rho \alpha \tau \eta v$: $\tau \circ \lambda i \tau \eta s$: $\tau \circ \lambda i \tau \eta v$; $\lambda \dot{s} \omega v$: $\lambda \dot{s} \omega v \tau \alpha$: $\gamma \dot{s} \rho \omega v$: $\gamma \dot{s} \rho \rho v \tau \alpha$. $\dot{s} \dot{r} \rho \eta \nu \alpha$ ($F \dot{s} F \dot{s} \rho \eta \nu \alpha$) by its action as a member of proportional groups is said to have caused the manufacture of $\dot{s} \dot{r} \lambda \eta \rho \alpha$, and $\dot{s} \dot{r} \lambda \eta \chi \alpha$ ($-\dot{s} \dot{r} \lambda \delta \chi \alpha$ and $-\dot{s} \dot{r} \lambda \dot{s} \gamma \mu \alpha i$).

CHAPTER VI.

ABLAUT AND ACCENT.

ABLAUT (vowel-gradation) is the name given to sound-variations in the vocalic elements of cognate words, or word-factors. These variations may occur in suffix as well as stem. Examples from Greek are most instructive, for the vocalism of that language has best preserved its original complexion. To illustrate the definition notice these:—λέγω, λόγος; λείπω, λοιπός, ἕλιπον; ἐλεύσομαι, εἰλήλουθα, ἤλυθον; ἀνάθημα 'offering,' θωμός 'heap'; ἕχετε, ἐχοντι (ἕχουσι); ἵππος, ἵππε.

These examples make plain the existence of some sort of methodic vowel-colouring. Before saying anything of the cause or quality of this, it will be well to put down in tabular form a definite portion of the facts that are to be reasoned on. Ablauts are arranged into various series, or reihen, as the Germans call them, according as they exhibit certain alternations of vocalic sound.

The ablaut-series are six in number, and receive these names:—(1) e-series, (2) \bar{e} -series, (3) \bar{a} -series, (4) \bar{o} -series, (5) a-series, (6) o-series. The e-series may further be subdivided into (a) e-series proper, (b) ei-series, (c) ou-series, (d) er-series, (e) el-series, (f) em-series, (g) en-series.

Omitting Sanskrit, which has merged members of the series, and Latin, which is not at all sensitive to variations of the root vowel, the sounds that constitute these series in

the languages we have under consideration may be set down as follows:—

Strong Gode Week Gode

ı.

		I. II.				III.		
		ī.	2,	3.	4	a. (no acct.) b.	(sec. acct.)	
(a) e-series	LE.	e '	0	ē	ō	0	(c)

	A.S.	im		n, om		um		
	O.II.G					um, om		
(g) en-serie	5	Repeat the above mutatis mutandis.						

1. (a) e-series.

For example of ablant I., take Sk. pitdram, Gk. varips; of ablant II., Gk. viećraps, Goth. fadar (this word, however, only occurs once in Gothic and that in the nom. or voc. sing.); ablant III.a., -r- (no vowel) in Sk. pitrā instr. sing., Gk. varpis, Goth. fadrs gen. sing.; of ablant III.a., -r- (lingual vowel) in Sk. pitrāhu loc. plu., Gk. carpāa, Goth. fadrum dat. plur.

This word owing to the presence of r, a letter with vocalic leanings, may have two forms of ablant III.a., one vowelless, the other exhibiting the usual representations of r.

Sk. pitå, Gk. carie, L. pater (for patër), are examples of outlying č, Gk. sbrárup (cp. L. (da)tor for (da)tör), of outlying ö,

Root see furnishes some excellent examples—ablaut I.—Gk. 76s.; seat; L. sedeō, sella (sedla), Goth. silan, A.S. sell; ablaut II.—Goth. silan set.' A.S. sellen (the c'is got by 's'umlaut); ablaut III.A.—Gk. I(selanba) 'seat,' L. sell' (seela); ablaut III.A.—A.S. selen p.p. Outlying long vowels—Goth. selum pret. plu, A.S. selon, A.S. sel' 'soot' ('a settling').

(b) ei-series:

For example of ablant I, take Gk. 200 'I saw;' of ablant II., Sk. vida' I know' (perf. used as pres.), Gk. olka, Goth. wolfi, A.S. wid (E. wot (Ch. woof)), O.HG. wid; (G. weity); of ablant III.a. Gk. 18th, L. widere, Goth. and A.S. witan 'know,' O.H.G. wippan (G. wissen); of ablant III.b., L. wins' seen,' Goth. weis 'wise,' A.S., wis, O.H.G. wisi (G. weis).

(c) cu-series.

For example of ablaut I., take Gk. 7000 'I give to taste,'

yrúsuar ¹I taste, ¹Goth. kinsan ¹choose, ¹A.S. cionan, O.H.G. kiosan (G. kiesen); of ablaut II., Goth. kdus pret, A.S. cious, O.H.G. kö. Ablaut III.a. appears in Goth. kusuns p.p., A.S. gecoreu p.p., curon pet. plu, O.H.G. gikoran.

(d) er-series.

For example of ablaut I., take Gk. \$\rho_{\text{op}}\text{w}, \ \ \text{L. fer\(\bar{o}\)}\$, Goth. \$\rho_{\text{oiran}}\text{, AS. and O.H.G. beran (G. geb\(\bar{a}\))ren', of ablaut II., Gk. \$\rho_{\text{op}}\text{is, Goth. bar}\$ pret., A.S. ber, O.H.G. ber.

III.a. appears in I. for's 'chance.' A.S. geboren p.p.

(e) et-series.

For example of ablaut I., take Gk. Three 'I draw'; of ablaut II., Gk. &three 'rollers, track'; of ablaut III.a., Goth. woulfs, A.S. woulf, O.H.G. wolf.

(f) em-series.

For example of ablau I., take Gk. **ips* 'I distribute,'
**ips* 'pasture,' L. nenns 'grove,' Goth. and A.S. niman
**take' (E. nimble), O.H.G. neman (C. nehman); of ablaut
III., A.S. and O.H.G. nam pret. Ablaut III.a. appears in
A.S. genumer p.p., O.H.G. fihoman.

(g) n-series.

For example of ablaut I., take Ck. rim» = rije 's tretch, L. tend's ; of ablaut II., Gk. rims 't tone,' L. ton's 'I thunder,' Goth. (u/) panjan 'stretch out,' A.S. Vinnan (r from a by i-unlaut); of ablaut III.a., Ck. rims' stretching,' A.S. Vannar 'thunder,' O.H.G. donner,' Co. donner).

Most ablaut-formations in Indo-European belong to one or other of the various sub-divisions of the e-series. In fact, the dominant position of e and e (or their substitutes) is one of the most outstanding features of ablaut.

The vowel correspondences hat various settings of e- and

o-sounds present in Indo-European alternate with each other according to a pre-established law of harmony. The appearance of this or that variety seems conditioned by the working of the elements of accentual action, viz., pitch and stress.

Not that it is permissible to suppose that one original vowel, say c, took on itself in certain circumstances the nature and semblance of o, for these appearances were felt to be, and were, mutually independent sounds.

Most likely so much of original individuality as is implied in the nomenclature a^r of (Chap. II. page 17), is to be assigned to the forms of the series. To say that the sounds appearing in the strong grade of the series have been always different to a degree, and without any $rap_{rochement}$, and that their existence has been co-eternal, is perhaps an attempt to solve the dualism by assuming the impossibility of its opposite.*

Sweet says: "Under the acute accent, a became c, under the circumflex (the syllable following an acute, unless another acute succeed, when the accent is grave), it became a and under the grave, it was dropped altogether."

Whatever the real conditions may be for the appearance of one or other member of the strong grade, whether or not original occurrence under the acute and under the circumflex accent covers all that is implied in the appearance of eforms and e-forms—and certainly c has naturally a high, e, a low pitch—there is no doubt whatever of the cause that gives now strong grade and now weak grade.

That cause is the presence or absence of the principal accent.

In Sanskrit, which has best preserved the Indo-European accentuation, the weak grade vowel, as a rule, occurs in the

^{*} See the account of Merio's theory at the end of this chapter.

stem-syllables of words that bear the accent on their inflexional elements, and even in Greek, where recession has wrought lawco on the original free accent, there still remains considerable attiris to illustrate the conditions that induced the weak grade. Note the grade in the following Greek words that have preserved the original accent (as indeed oxytones very often have):—wwwfe, werbal of wideau, herin, and inf. of hafen. When recession set in, the vocalic quality of syllables had been fixed, and did not change with the changing accent, e.g., Jun, 1 plu. pres. of har 'go,' must originally have had the oxytone accent, but the change in accentuation did not alter the vowel.

With these few remarks the tables ought to be self-explanatory.

There are two distinct forms in the strong grade, and one form in the weak grade, with more than one manifestation. It will be noticed that the e-series has attached to it outlying forms with the long vowels \tilde{e} and \tilde{e} , occurring presumably under the same conditions as e and o. In the, same series the weak grade \tilde{a} is vowelless, e.g., σ rietau, aor. inf. of $e^+\epsilon \nu \mu \nu \mu \nu$

It is difficult to believe that in forms like this the loss of vowel can be accounted for by a mere lowering of pitch. It would seem that the transference of the accent involved transference of stress, in fact, that the acute accent was accompanied by a strong stress.

The developed vowel of weak grade & (written s, &c.) can hardly have been pronounced like the same vowel in strong grade. The development of the vowel is partly due to the necessity of making the form pronounceable, e.g., insersé, partly due to the analogy of the strong forms.

Here follow tables of (2) the \bar{o} -series, (3) the \bar{a} -series, (4) the \bar{o} -series, (5) the a-series, (6) the o-series.

•						
		Strong G		Weak Grade		
		I.	11.	II	L.	
		ı.	2. a. ((no acct.) b. (sec. acct.)		
2. č-series	I.E.	ē	ō	0	•

	O.H.G.	8	110		· a	
6. e-series	I.E.	•	ō	07	(o) ·	
	Gk.	•	•		•	

There are some who explain the long vowels of the long series as compressions of diphthongic combinations of e and o with the vowel seen in the weak grade (cp. ei, oi, i). But such explanations are very much in the air.

2. Eseries.

For example of ablant I., take Sk. dddhāmi 'I place,' Gk.

*/hgu, Goth, gadēps 'deed,' A.S. deā, O.H.G. tā! (S. thaf); of ablaut II., Gk. δωμές 'heap,' Goth. döms 'judgment,' A.S. döm, also doi '1 do;' O.H.G. thom, also doi 'dees' (G. thun); of ablaut III.a., Sk. dadhmá; τ plu. pres.; of ablaut III.δ., Sk. ddhila, 3 sing. sov, Ck. řövr, brés.

For example of ablaut I., take Sk. dsthām x sing. aor., Gk. isra, L. stāmer warp.\(^{1}\) Ablauts I. and II. coincide in Teutonic—Goth. stāma \(^{1}\)basis, substance, stād \(^{1}\)stock (O. d. stad). For ablaut III.a., take tasthhith, weak stem of part, perf. act. \(^{1}\)for ablaut III.a., Sk. sthilds past part., Gk. oraris, orans, L. statiō, Goth. stalp \(^{1}\)shore. As. stato, O.H.G. stado (G. staden).

Brugmann gives no Teutonic illustrations of this ablaut. Ablauts I. and II. coincide. For example, take St. dddāmi, Gk. bābau, bāpen, L. dāmm. Of ablaut III.a., take as examples, L. de-dē; of ablaut III.b., Sk. ddiia (di = db), 3 sing. on, Gk. bāws 'gift, 'L. datu. In beris, beris, ibere, form-association brings in a.-

4. ö-series.

5. a-series.

For example of ablaut I., take Sk. bhdgas 'distributer;' of ablaut II., bhāgas 'share, lot,' Gk. pnybs 'oak,' L. fāgus 'beech,' A.S. bōc 'beech,' O.H.G. buohha (G. buche).

There are some examples of an ai-series, e.g., ablast I., Sk. ádhas 'firewood,' Gk. aibs' kindle,' L. acats' hearth, house,' A.S. ād 'pyre,' āt 'kiln' (E. aat-kouse), O.H.G. cit 'pyre'; ablaut III.a., Sk. idhmás 'firewood,' Gk. hlasp's 'serene, pure'; of ablaut III.A., L. tālis (nactās) 'the class' rights,' A.S. tatel 'empty' (E. idle), O.H.G. ital. 'pure, clear' (G. cital).

6 aseries

Ablaut I. and ablaut III. o. coincide. For an example of ablaut I. take Gk. south, L. odor; of ablaut II., south; 'sweetsmelling.' Teutonic instances are infrequent.

According to the tables, each family of words has a triplebarrelled root, and from each of the barrels have been shot those formations that affect the several ablauts. There can then, from a practical point of view, be no question of the root of a word, but only of the root-forms that find exemplars. These radical triesmit need not, however, be taken too

literally.

All three forms are not always found, indeed, some weak

grades of great antiquity occur, which have no strong forms ranking with them, e.g., \$\psi_{\text{total}}\text{stab}\$. The gupa theory, that original \$\epsilon\$ and \$n\$, by the action of a multiplier \$n\$, gave products \$n\$ and \$n\$, which in European branched off into \$n\$, \$c\$, \$n\$, and \$n\$, \$n\$, must with the establishment of the mutual independence of the root-forms be given up.

The fact that certain formations favour certain ablants may be illustrated from Greek. Irregularities are due to form-association, or false analogy, as it is called. Late formations may also from the beginning take on them an' ablant different from that proper to original examples of the same formation. The accentuation also is not always what the ablant postulates.

In verbal formations, ablant I. is the abbant proper to (a) the active singular of non-thematic presents— $s_i \mu_s$ (cp. $p_s \mu_s$), $p_s \mu_s$ (cp. $p_s \mu_s$) (non-thematic—suffixing inflexional elements directly to root or stem, without the intervention of the thematic vowels s and $g \rightarrow s_s \mu_s \mu_s$. One-thematic middle with strong root, shows irregularity—(b) the active and

mīddle, singular and plural, of thematic presents that belong to the first or hān-class of the Sanskrit grammars—Figs, siz-p, pitikugu 'spare,' psiy-w (2) the futures, active and middle—rip-los, zineau, cristopau (2) the first acrists, active and middle—Tip-los, zineau, cristopau (2) the first acrists, active and middle—Tip-los, lineau, spareau (3) the first acrist pastive—firstpless, insiden, terminden.

In nominal formations, ablant L appears in (a) sestems—
βλικ, τίχρα, ζώγγα, κριωκές, but βάθες (also βάθες), εάθες,
βέρες, κρίπες have conformed to the vowed of βάθες, εάθες
βέρες, κριπές have conformed to the vowed of βάθες, εκθικ,
βέρες, κριπές (b) nouns in -ας.—σίλας 'brightness' (c)
nouns in -του, -τη, -της. -τρεν—σίτνος, διλέστες 'trainer,'
γίττες, βίριτεγο 'bier' (d) nouns in -μας. παλ μολων—σέρες,
λάξωσ, γτόμα 'taste,' τίριων 'boundary,' τπόμων 'lung' (e)
comparatives and superlatives in -του, -τους.—παρθως, μέγρονς;
βέρενα and λίπθεων με η.ενω 'formations, on the model of
μαιρές μάσενη, made after the nasality of their root-vowel
had disappeared (the theoretical forms would have been
βέγχρια, λίγχρια) (f) words in -ενας, -ανα, -ανη, -ανηστίγωνε 'covered,' λάλεων 'remnant,' μελόγ 'fence, βιλέση
'needle,' but these also appear with ablaut IL—χέ(ξ)ωνς
'melting-pot,' δέγμανω, βέραμ' tenclosure.'

In nominal formations, ablant II. appears in (a) nouns in -ιδς-γονώς φονώς (b) many stems in • and η-ἀοιδές, ατόξος 'row,' φόρος, σκοτή, βολή, but έργον and λιυκός have

nouns in - 40; take ablaut I., and 1144 shows ablaut III.

In verbal formations, ablant III. is the ablant proper to (a) the dual and plural active, and the entire middle, of non-thematic present indicatives, which originally received the accent on the terminations—Jun Fine (cp. 4/44), spatis paris (cp. 5/44), but is the first, &c., have conformed, as may be seen from St. 5mbs, L. 5mms, and to the optative and participle of the same presents—pain, \$\phi_{\text{start}}\$ (b) reduplicated non-thematic presents—Gir. \$\phi_{\text{start}}\$ (a) reduplicated thematic presents—\$\phi_{\text{start}}\$ (b) (c) \$\psi_{\text{start}}\$ (c) reduplicated thematic presents—\$\phi_{\text{start}}\$ (c) \$\phi_{\text{start}}\$ (c) \$\phi_{\text{

ticiple of the same presents— $pain_k$ pássus (b) reduplicated non-thematic presents—Gk. $aipan_kan$ (Sk. pipymán) (c) reduplicated thematic presents— $\gamma j \gamma_k a_k a$ (c), $\gamma i \kappa c_k$, where $\alpha i \gamma_k a$ $\alpha i \gamma_k$

propse propse (7) vertes to the in-cases—propse, aryou (cp. dispa), but disque and \$\(\begin{align*}{c} \) vertex with abbaut 1. \$\(\text{these vertex} \) correspond to the Sanskrit su- and \$\(\text{tan-classes, which form in reality one class, for sumbari: \$\text{tan-bari: tan-bari: t_n-bari: t_p-n-bari: t_p-n-ba

red,' rerpaiss 'pierce' (cp. reips) (h) the dual and plural indicative active, optative and participles active, and the entire middle of the second agrist of as-verbs (the singular indicative active has strong root, and the strong vowel of the singular has often been driven through the other persons)-βάτην, "βαν, βαίην (cp. "βην); ἐστάμην (cp. ἔστην); εχύμην, ἐσσίμην (cp. ἔχευα, ἔσσευα, which are not sigmatic agrists with a dropped, but root-agrists, with an ablaut I. that originally only occurred in the singular (cp. for a similar alternating ablaut the \$1 and \$1 of the imperfect of villau) - a: x:: v: sv - the terminal a is for m) (i) the ordinary second agrist - form (cp. icm), ixram = ixrum (CD. ATERN = ATERIA), TANTON (CD. ALIEN), TOUYON (CD. OSUYN). · ελαβα (cp. λη ψομαι), the original accent appearing in infinitives and participles-ribin, with: some agrists take irregularly ablant L. - frazer, werker (1) the second or strong aorist passive-iμίγην, ίζύγην, ἰδράκην (cp. δέρκομαι), ἰνάκην (cp. riraxa), but i-τλίκην, a variant of i-τλάκην, has conformed to πλέκω, and others to other strongs; (&) the dual and plural active, and all the middle of the perfect indicative as also the optative and participles active and middle (the singular active has, as we saw, ablant II.)- "izrov ilizmy (cp. forza), iciculus (cp. circula), ioros lous louis (cp. olos), verhains (cp. τετληκα), iληλύθαμεν (cp. είλήλουθα), μέματοι μέμαμεν usuade (cp. usuosa), soraros sorauss (cp. sornaa). Conformation, however, has as a rule made the strong form prevail throughout the active. Ablaut III. prevails pretty generally in the middle-μέμιγμαι, κέγυμαι, έστραμμαι, λέλασμαι (cp. λέλπθα). Verbs like λέγω necessarily insert an ε in λγμ of the theoretical ablaut III., e.g., λίλεγμαι. Ablaut III., in these cases, resembles ablaut I., and has given rise to analogical formations, where the correct ablant might have appeared, e.g., σίσλιγμαι, which modelling after ἐσλάκτι might have appeared as σίσλαγμαι,

In nominal formations, ablaut III, appears in (a) verbal adjectives in -ris and -rise-strates 'pressed' (cp. 671/34), iuris (cp. ii(f)w), caris (cp. enul); herris from hirw and ixro; from 120 inserted an 1, and on these many analogical formations have been modelled, e.g., expenses for espanses; forms duzries, reverie, &c., also occur: derés and berés, &c., assume a vowel which graphically is the same as that of the strong grade forms; note also sparis, with the long yowel of sixvius; nouns in -res and re take ablant II -- zerres. Sport (b) abstract nouns in ti (-a) which originally had accent on suffix - =10=15, rasis = risis (cp. reha = renia), napers = nreis 'a clipping ' (cp. zsieu = zseiu), cárs; (cp. ozui). In bies; and ding, instead of the regular a, s and a appear, compare derés and derés above; forms like zifis, &c., develop an s, and have been the starting-point for many similar formations (r) certain adjectives ending in - sor, with accent on . suffix-i- i, νόρδη, γλυπερός, μαπρός (cp. μέπιστος) (d) oxytone adjectives in -u;- βαθύς = βμθυς (cp. βίνθος), γλυκύς (cp. dy).tuxές 'sour'), but ώχύς and έδύς with strong root.

Latin, as has been already remarked, is not at all sensitive to vowel-variation, and furnishes but a meagre supply of illustrations of ablaut. One or other form has prevailed, and levelling has robbed the vocalism of its variety.

It is however necessary to give a little more information about the Latin ablaut than that furnished by the stray examples already noted. Perhaps there is no example in Latin of a root with triple forms, unless that is to be found in ftdo (feido): foedus (foidus): fidis:: "with: "rivule ; crevés. There is only one objection to be made to this proportion, and that is, that esstems regularly take ablaut I., cp. 197,05, &c., as above.*

Examples of roots with two forms occur in :—(ablauts '
1. and II.) sequer (weaps) and sectins (i-view 'attendant'),
tryo (viriys) and dags, nex (view) and neces' is (biblauts 1. and
III.) for (view) and fore (birth), dies (delso, delsoia) and
dels: causa 'for form's sake,' dies (delso) and dux dikis;
(ablauts II. and III.) mones and mens (Sk. matts, matk).

Verbs like lego (ablaut I.) and tondeo (ablaut II.) dominate with their ablauts their respective word-groups.

In verbs like scindo, jungo, &c., and their cognates, ablaut III. appears.

. In Gothic, original differences in root-vowels remain fenced off quite absolutely. From verbal forms, and verbal forms alone, we may get in Teutonic illustrations of most of the ablaut-series. The principal parts (inf., pret. sing., pret. plu., p.p.) of the verbs in Gothic, Anglo-Saxon, and Old High German, will thus furnish an excellent mnemonic for ablaut-vowels in their respective languages.

Ablaut I. appears in the inf., ablaut II. in pret sing., ablaut III. in pret. plu. (except in gibum, giafon = gibfon, gibum, birum, birum, where the outlying long vowel of the eseries appears) and p.p. In the a-series ablaut II. appears in pret. plu. as well as in pret. sing. A reference to the tables will establish the regularity of the vowel representation.

 Victor Henry suggests that foedus may have changed its declension (orig, second) to avoid confusion with the adjective foedus. For foundus, the other example of an es-stem with ablaut II., a similar explanation is probable (cp. fondo in Livy, &c.). Gothic verbs come first, then Anglo-Saxon, then Old High German, afterwards follow Greek forms with the same ablaut, for comparison.

There is thus an extensive use of ablant for form-building and form-differentiation in the Teutonic verbal system. Sweet says that this big manipulation of vowels in verbal formation may be due in some measure to the influence exerted on Teutonic by the Ural-Altatic languages (Finnish, Magyar, Turkish, Mongol, &c.) spoken in close proximity for many centuries, which are dominated by a law of vocalic harmony that, to speak generally, requires that one class of vowels (these are divided into strong, weak, and neutral) should obtain in the various syllables of a word. At any rate the adaptation of vowel-differences to the expression of tense-distinctions, with which, being due to accentual action, these differences had originally nothing to do, owes much to a long striving after symmetry.

· Towards the close of the Middle English period the ablaut of the pret. pin.-was accommodated to that of the pret. sing., a state of things which is reflected in Modern English—drink, I drank and we drank, drunk.

In the southern dialects the vowels of the preterite and participle are identical, the deeper vowel having always prevalled, so that now there are but two ablaut forms in the somewhat insignificant number of verbs that still, with an added weak endine, exhibit owel change.

In the New High German forms it will be noticed that the tendency is to assimilate the vowels of the pret. sing, and pret. plu. in quality and in quantity,—N.H.G. gāb gāben for O.H.G. gab gāben, &c.

In the pret, sing, of triban, ei has been lost, and the

vowel of the plural and the past participle assumed. This has become a long i (written it) by the law which ordains that a short vowel becomes long in New High German when it occurs in an open syllable, i.e., when followed by one consonant and a vowel.

For O.H.G. truog, N.H.G. has trug. For uo simplified into \bar{u} , compare the simplification of ie into \bar{i} (written ie).

Of the ablant that once had a definite place in declension there are, save in Sanskrit, scant remains. The condition of things that the Añga, Pada, and Bha bases disclose in Sanskrit declension must have had its analogue elsewhere. Conformation however has efficed the plurality of stems that once figured in declension. One language has generalised one form, another, another, e.g., in the word for fost, Greek has generalised the e, Latin the e, and Teut the ē—Gk. ebba (Dor. ebb), but cp. eige, L. pedam, Goth. fātus, A.S. fōi, O.H.G. fass, (G. fust).

The Indo-European declension is said to have been this:

 N.
 póds
 D. pdáj (bdáj)

 Acc.
 pódm or pódm
 G. pdós (bdós)

 L.
 pédi

Gk. 1 cr/6 day after the feast' is usually given as an example of the weakest stem.

In words like Gk. Assoti, gen. Assoti, a curious result has been reached. The strong ablant of the nominative argues for an original accent on the stem syllable, but the genitive which retain its original accent must have had originally weak ablant. A sort of phonic contaminatio has been the result with the vocalisation of the nominative and the accentuation of the genitive.

Sundry remarks have several times been made on the influence of accent on ablant, and in this chapter it will be quite fitting to set forth some facts about accent in Indo-European and the languages that have sprung from it.

First, then, as regards place, the Indo-European accent naturally a word-accent, and confined, in the same circumstances, to the syllable chosen—was free, and could rest on any syllable, whatever the quantity. That this is so, can be proved from the accented Sanskrii of the Vedas, from a proper interpretation of the phenoma of Greek accentuation, and from the effects of accentual action established by Verine's Laut.

The correct historical account of Greek accentuation is not that which assumes recession as a first principle and explains divergences as exceptions, but that larger view which discerns that recession proper is an intrusion upon a state of things in which each syllable was mutually eligible for accentuation.

Verner's Law (see Chap. on Grimm's Law) revealed in Teutonic the workings of another mode of accentuation than the historical root-accentuation.

The corroboration that accentual facts in Greek and Teutonic find in Vedic Sanskrit goes to prove the primitiveness of the free accent in Indo-Buropean. What principle regulated the session of the accent, now on one syllable and now on another in words and word-groups, is not, and can in the nature of things hardly ever be known.

Among the Indo-European languages Sanskrit as a rule retains the original position of this free accent. Very often, in spite of many divergences, a free accent that obtains in Lithuanian furnishes results that corroborate those furnished by the Sanskiti. Strange to say, Lettish, a language which can be converted into Lithuanian, if certain laws of letter change are carried out, has dropped free accentuation and adopted initial. This but illustrates the truth, of which there are many examples, that accentual systems are most mutable.

Russian still preserves specimens of the original free accent. Bohemian, like Lettish, accents the first syllable. Polish has generalised the penult accent. Cyunir (Welsh) has done the same. Keltic (Irish) shows an initial accent. Teutonic has developed a radical, which, except in compound verbs is practically an initial accent, due doubtless to the generalisation of those accent-types that already on the old system had the accent on the root.

It is plain from what has been said, that languages starting with a similar accentual system may depart from this, and each, in different areas, and following out its own bent, reach an identical result.

Greek of course retains many instances of accents in the original position. In fact, resistance to recession is fairly, reliable presumptive evidence of primitive accentuation. The position proper to recession may evidently also be that which was occupied by the free accent formerly in yourse.

Modern Greek has a stress accent on the same syllable on which historic Greek had a pitch (Afus stress?) accent. Stress' then has taken the place of pitch (or, to follow Sweet, 'the stress has been kept while the intonation has been set free'). But it would appear that the musical accent may still be heard in some parts of Greece. J. T. Bent in Macmillan's Magazine for August 1883 speaks of a Chian pronunciation of Lofewer, in which musical cadence is present and the quantity of the preserved.

Latin is dominated by a new law of accentuation. Barytonesis has prevailed. The law (excepting monosyllables and certain particles) is simply this:—If the penult is long, it carries the accent, if short, the antepenult carries it. Spellings, however, like airfaic (through dasfacid), and air_ situs (through degainut), argue the previous existence of another than the historic mode of accentuation.

So much for the position of the Indo-European accent what about its nature? Was it one of pitch or of stress, was it musical or expiratory?

In the Old Italic dialects, in Keltic, in Teutonic, and Lithuanian, we have to deal with expiratory accent; in Sanskrit and Old Greek, the accent is said to have been musical.

That the accent in Greek was musical seems to follow from the very names given to the accents, from the fact that in Greek poetry the ictus is independent of the accent, from the fact that, as a rule, the syllables that follow the accent are not subject to weathering, not to mention the committing language made use of by the ancients in discussing accent.

Brugmann says that Sanskrit and Greek could hardly, if the accent had been expiratory, have kept so well the old inherited condition of the sonants.

Since, according to the same authority, Sanskrit and Greek, as separate languages, hardly ever require the assumption of expiratory accent to explain phonetic changes, it follows that contrasts like **ringate **ringate*, which, as has been said, do seem to require more than a lowering of tone to account for the loss of the vowel must

be referred to the pre-separation period. This postulates for said period the prevalence of expiratory accent. Brugmann comes to the conclusion that the Indo-European accent was at first mainly expiratory, but that towards the close of the joint period it had become mainly musical, a stage which is represented in Sanskrit and Greek. Verner was of opinion that the original accent was musical (chromatisch)

The following quotation exhibits Sweet's opinion on the matter —" Intonation is not necessarily associated with stress, but there is a strong natural connection between them, and the history of the Arian (Sweet prefers this to Aryan) languages shows clearly that in them high tone was accompanied with strong stress, for the weakening and dropping of vowels in unemphatic syllables, which is carried to such an extent in parent Arian, cannot be explained as due to mere lowering of tone.

Some account will now be given of the origin of the recessive accent in Greek, as expounded in Bloomfield's masterly articles in the American Journal of Philology (Vol. IV., p. 21; Vol. IX., p. 1.).

Recession is seen at its height in the finite verb. It has effected a lodgment there that argues verbal quality and verbal origin. The verb is the niture for diffusion, and in the verb, recession is the mode in which a fact in sentenceaccentuation finde expression. To use Bloomfield's words, 'recession is a substitute for enclisis.' The Indo-European finite verb, in principal clauses, functioned as an enclitic. This is reflected in Sanskrit, where the verb in principal clauses (except when first word of the clause, or in antithetical construction, &c.), is enclitic, and in subordinate clauses, orthotone.

In Greek, the enclisis must have affected the finite verb as a whole. Its substitute, recession, works under certain: restrictions. Only two syllables are left unaccented, and not more than three moras (the mora is the unit of quantity). The word must end in a trochee, before three moras can be left without an accent. In accentuations like x\$\frac{1}{2}\sigma_1\$ it is the second of the two moras constituting the long yould that bears the accent.

The same limitations obtain in ordinary enclisis depends res, wasis; ress, he/yer ords. The similarity of the conditions that fetter ordinary enclisis and recession is most simificant and successive.

It ought to follow that, in the absence of the aforesaid 'restrictions, the finite verb in Greek is still enclitic. And this is so. The verbs isla and paul are enclitic, and they are the only verbs that throughout a whole tense present conditions favourable for enclisis. Take isla (isl, ieri, ieris, ie

As to the non-enclitic character of v^i and $p s_i^c$, the orthotonesis can be accounted for. v^i , if it be not considered an Attic late form, and subsequent to the establishment of enclisis, is a reduction of $t s_i$ St. $d s_i^c$ (the reduction of the s_i^c of the root, and the s of the suffix (eps s_i^c and $t e_i^c$ of the suffix (eps s_i^c and s_i^c of the root, and the s of the suffix (eps s_i^c and s_i^c of the root, and the s_i^c of the root s_i^c and s_i^c of the root s_i^c of the root s_i^c and s_i^c of the root s_i^c

\$46, as is natural with the person addressed in a verb of saying, occurs only in subordinate clauses, or in co-ordinate clauses that are interrogative, or point an antithesis.

\$\phi_{ij}\$, then, escaped the enclisis that beset the other
persons of the tense, owing to its natural usage in
subordinate or antithetical clauses, where enclisis did not
have a footing.

Enclitic isrr also appears as the non-enclitic isrr at the beginning of a clause, or when preceded by a word too weak to receive a receding accent.

Exemption from the enclisis of principal clauses accounts too for the retention of the elymological accent by infinitives and participles, and that even when compounded.

and participles, and that even when compounded. Some other facts in Greek accentuation that are doubtless due to the play of sentence-accent may be mentioned here, such as-(a) the appearance of the acute as a grave, when followed by a full word; (b) the accentuation that differentiates interrogatives and indefinites, e.g., 7/5 and ris; (c) the existence of proclisis, which naturally is lifted in emphatic positions, of freeing itself at the end of a sentence, &c., we and \$2, when occurring after the conjoined wordas to 6 and \$\displays (Sk. s\delta and s\delta), these were at least helped towards proclisis by a desire to differentiate them from the relatives & and & of and at following their analogy; (d) the behaviour of dissyllabic prepositions in and out of anastrophe: of their positions, that in which the so-called anastrophe occurs is the more ancient, and its accent the more original, the oxytone accent of the prepositions in their later position being really a substitute for the proclisis that is seen in monosyllables like it (proclisis admits of tonelessness only in monosyllables); that the paroxytone.

speaking generally, was the original accent of dissyllabic prepositions, is proved by the fact that the Sk. cognates are of this accent—ief, ctri, bet (Sk. 6pi, peri, inpa), and by the fact that, when used as adverbs, the prepositions bear is the paroxytone accent.

Recession established in the verb passed to the noun. The procedure was by analogy. Certain nominal types that in volume of sound were numerically and quantitatively the equivalent of the frequent work-a-day verbal types adopted in certain sympathetic conditions their intonation also.

These fresh creations would reinforce the nominal types that already on the old system had the accentuation that recession would have given. The accentual types thus established among nouns became a force in determining the accent of differently accented nouns that might be associated with them. The types that accorded with the new law were widely exercalised.

Common words would become the nucleus of groups that affected the new, or, it may be, retained the old accentuation.

This is Bloomfield's account of recession. It is preferable to Wheeler's. The latter claims that recession was not verbal in its origin, but due to the action of a phonetic law affecting the whole language, and operating by the development of a secondary accent (afterwards in part the principal accent) that rested on the third mora from the end, or, in polysyllables of trochaic ending, on the fourth mora.

It ought to be mentioned that Brugmann has adopted Wheeler's theory in his account of Greek accent. Before closing this chapter it may not be out of place to say that quantity has a certain, though not necessary relation to accent, and that the quality of a long syllable is probably not so even nor so pure as that of its corresponding short.

The only systematic attempt known to me to clucklate the relation between the c and e-grades is that made by the law First Nation in an essay entitled "Ragione del permanere dell" A e del soo mutarsi in Si(0) sin dall" est protectionan." In this, while distinctly admitting the existence of e and e in the latter portion of the joint period, he inclines to the belief that, in the earlier portion, these voweds were both still latent in an untable e with no definite point of articulation.

It was, of course, in full-grown words that the conditions for vowelplay in general were first definitely presented. The original dissyllable root-forms present in words were afterwards so blended with the suffixes as to look like mononvilable roots.

Under the action of the neute accent, helped by the frequent presence of a terminal -i (ep. Glc, µ, a, r, r), these unstable a's passed in verbal forms to e; on an alteration of the cadence of the accent there followed in a labil neighbourhood a colouring into a. This labil neighbourhood must have often been present in nominal forms owing to the frequent occurrence in these of an -w, e.g., in the accumultve and in neuter nomes.

Naturally it was in phrases rather than in words that the swing of a nustical accent helped to introduce vone-coloring. We may suppose that a word had two lives, its sentence-like, and its individual life. So far as the latter is concerned, we have to remember that accentual change involves rowel-loss rather than rowel-change to the syllable concerned.

Perhaps the differentiation exhibited in vowel-colouring was particularly used to distinguish verbal from nominal forms. It is a fact that of the two ablasts of the strong grade the e-ablant is the more common in verbal forms. There are not so many verbal forms with the e-ablant—**Péoces. ***Francé. &c. and écolo. &c. écolo is a veri formed from a nominal base, and perhaps the perfects may be exclaimed from the side of the noun.

The coincidence of this difference in vowel with a difference in functive world give to vowel-colouring an established position in wordlymavion. Afterwards, when the existence of full verbal and nominal system farmished other characteristics for the two classes, and supplied nature was bond of attachment between members of the same class, there did not exist the same impulse to utilise vowel-colouring, and verbal formations with the e_s and nominal formations with the s-ablant became things of common occurrence.

It is to be supposed, too, that the action of analogy often helped to obliterate functional distinctions.

Merio's theory of the origin of a forces him to give some explanation of the a's that have remained.

The firal i that helped to bring in s was characteristic of active verb, war a mark of transitiveness. Intransitive verbs were likely to retain the s, unaffected as it was by the attractive force of an i (compare the diphthongs -pas, -vas, -vas, in the Greek middle).

Merio gives a lite of words where the e (real e is meant, not the autiliary at of linguals and nosals) has persisted alongide of the e of cognate words. It is necessary to affiliate the former to intransitive verbal forms. It must be confessed, however, that many of the relationships set down are far-feeded and some of them improbable. As specimens of his camples take patters, patters parvar, -patters (perstars); amogre, Servaker.

Verbs with the vowel a that are now palpably transitive, such as \$790, may be supposed to have put on transitiveness at a comparatively late date (agure has distinct intransitive uses), or to have had their vowel conserved by the influence of cognate intransitives.

It is undoubtedly true that the e of the new and vigorous formation would get extended beyond its sphere. It is also true that neuter verbs may in virtue of their meaning pass naturally into transitive verbs.

CHAPTER VII.

GRIMM'S LAW.

It will be well to gather together into one chapter the facts. that relate to Grimm's Law, and to add needful explanations and comments. It will also be expedient to use in this chapter nomenclature as simple and as accurate as nossible.

The bare facts relating to this Law have already been fully set down in Chap. IV.

Perhaps the first fact in the domain of law that one hears of in connection with linguistics, is the fact of the existence of Grimm's Law. Many a guess, perhaps crude, perhaps plausible, has been elbowed out of court by its means. Undoubtedly its application and the test of truth it furnished, have contributed most powerfully towards changing what was previously a mere science of guessing into a rational science, not the least part of the reason and precision of which has been got from its pioneer in the pursuit of truth—the science of phonetics, the science that admits of no exceptions to its laws.

Grimm's Law is one of the weightiest facts in consonantal phonetics. And provided that it is recognised that other laws may traverse the field of its operations; provided, especially, that it is remembered that the law is an induction based on many facts, but not on all, and that trouble has been taken to learn how that residue of facts has been explained and grouped; provided too, that it is not forgotten that the second change was never fully carried out, one must subservicutly respect this, as all other phonetic laws.

One must remember that the letters of the formulee do not have the same value in each of the terms of comparison, that similar changes took place over less areas and with other terms of comparison, and that the scope of the law was extended for the sake of theoretical completeness. To take for granted that hard, soft, and aspirate, mean the same in each group, to write as if sounds were on a dead level of sameness in the first group, to speak then of the inevitableness of the interchange of these fixed and unchangeable sounds, to add to this, expressions such as 'conscious replacement,' is to give the law a superimpo-ed, predestined, and pre-ordsined character, or, as an alternative, to make the speakers of the languages concerned foresee their own development, and work it out consciously and of set purpose.

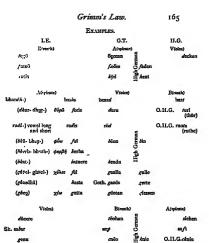

With regard to that primitive state of the Indo-European peoples in which they used the same language, it must not supposed that the original tribes dwelt as next-door neighbours within circumscribed limits, for they were separated by long distances, though still in touch with each other. They observed various attitudes toward the sound-norms, land certainly much in common, but were also predisposed to change in different degrees and along different lines. Each family of languages, each system of sounds, had its own idiosyncrasies.

Perhaps the relation of the sounds of the languages used by these tribes to those of an earlier parent-speech, more or less ideal and the result of analysis, may be fully compared in some points to the relation between dialectic sounds and the sounds of the standard speech, though here the check on change ought to be greater, provided aid is to be got from a rational and consistent representation of the sounds in writing.

What then is Grimm's Law? That will better be understood at the end of the chapter; meantime, it may be defined, by anticipation, as the expression of relations, neither isolated in their occurrence, nor extraordinary in themselves, that obtain between the consonants of Indo-European, General Teutonic, and High German. These relations are exhibited in the following table:—

The examples of the law are taken in G.T. from Anglo-Saxon unless when Goth, is prefixed.

I.E.			G.T.			H.G.	
B(reath)			A(spirate)			V(oice)	
T			TE	T 4 7	g		D
P			F	\ь/	8	F	
K			п	V	High German	H	
	A(spirate)			V(olce)			B(reath)
D'	0	B, F, D			Dan		T
B'	Ф	∯ F, H, B	В		Š	В	p
ď	x	¹ F, H, G	G		High German	G	k
V(oice)			B(reath)			A(spirate)	
D			T		E		TS, S
В			Р,		를		PF, F
G-			K		High German	ĸ	СН

Not all the changes are recorded here, but the most noticeable for the understanding of the law. I.E. = Indo-European, for which Indo-Classical might serve; G.T. = General Teutonic, a term including H.G. = High German, which suffered the first change along with the other languages, sometimes went no further, and sometimes exhibited both the earlier and later changes. In H.G., a capital letter indicates the usual, a small letter, the occasional change.

Low German is a name sometimes given to languages other than High German. Its appropriateness, when one considers the date of the facts under consideration, is questionable. German writers on Teutonic philology do not include Anelo-Saxon among Low German dialects.

Voice and breath are used as decidedly more truthful terms than soft and hard, sonant and surd, tenuis and media. Aspirate is used for convenience. A vowel as initial letter gives, by using as contractions the first letter of the above terms, convenient mnemonics B.A.V., A.V.B., V.B.A. These may be simply remembered. Thus:—Let

be an equilateral triangle, and name it in succession from left to right either B.A.V., A.V.B., or V.B.A.

But besides being in this way convenient, aspirate is a fit enough label to describe sounds that differ in Indo-European taken by itself, and have a value in General Teutonic different from that which they have in Indo-European.

It would appear that it is wrong to represent the Sanskrit aspirates by DH, BH, GH. Native Indian scholars ridicule the representation, and Mr. Ellis says that in listening to the pronunciation of two native scholars, he could detect only a glottal buzz after the stop. Exact writers now use D', B', G', for the Sanskrit aspirates.

The Latin aspirates are continuants. As to the Greek aspirates, the Romans evidently thought them breath stops

followed by something, for they represented them by ch, th, ph.

High German TS (=z, S=st) and PF (pf, f) are not aspirates at all, but affricates, double sounds opposed to spirants. CH is a continuant. For further facts about High German consult Chap. IV.

The d, b, g written within the V in G.T. B.A.V., are produced by the operation of Verner's Law, of which more hereafter.

It will now, after having briefly stated the law, and tabu-

lated the salient and representative changes, with examples, be proper to speak of some of the changes registered therein. To begin with, the changes exemplified are to be seen elsewhere, in other groupings, even within the limits of the Indo-Classical group. In one language—Armenian—all the changes are met with. Proof of a wider extension for the facts recorded in the law must contribute much towards an explanation of these. If certain phenomena have the attribute of universality, or even of frequent recurrence, their explanation is within measurable distance, or rather, no special explanation is needed, for mere difference of degree may be easily accounted for.

The change of breath into aspirate is found in Iranian, where c became f before consonants, in Armenian, where became f before covers and medially, in Umbrian, where primitive Italian ft became ft. To be noticed also are reste and Umbrian relate, irrups and Sk. stath, ware, and Sk. path, bixquar and diyquan, rives and rivpspa, lieu and dixips (see, however, Moulton's Law, further on).

The change from aspirate to voice is to be met with

in Armenian, where dh became d, and in Iranian, Keltic, and Balto-Slavonic, where the voiced aspirates became voiced stops.

As examples of voice into breath, we have in Armenian, the change of d and g into t and h, in the Indo-Classical group, the change of Sk. bh into Gk. φ and Latin f, both breaths. The Latin f afterwards became h in certain surroundings, thus illustrating aspirate (spirant) into voiced stop. We have also to note such alternations as ανασία, O.L. scapra, scabh. Compare also, continging ourselves to initial letters, Italian gastigare and gonfare with castigire and confiders, Spanish gritar and greda with quirilâre and critican.

The changes, then, are not isolated, and many more examples might be given; but, in their case, juxtaposition and consequent assimilation, or some law of euphony, would more manifestly account for the result. It is impossible to explain away these examples by their settings: they are too general to be explained by any local cause. And in this connexion it is well to remember that Grimm's Law in some of its features may register the extended scope of small beginnings, more or less originated by local causes. At anyrate Brugmann himself begins his exchangion of \$\rho\$ into

It results, then, from the above remarks, that other groupings would furnish more or less of the phenomena of Grimm's Law, that, in the Indo-Classical group, and within the area of Armenian alone, we have all the features of the law represented.

f. &c., by assigning a local cause to start with.

The facts, then, of the change are to be seen elsewhere. It will be well now to consider the nature of the changes. Are they unique in themselves, or is it their spread and the regularity of their occurrence that is most noticeable?

The prevalence of the change from breath to aspirate, or breath to spirant, is perhaps a sufficient voucher for its naturalness, but the change in itself is quite comprehensible. Brugmann, in his account of the change of p and k into spirants, says that, to begin with, p and k, when beside t and t, changed into spirants, and finally everywhere else. This is to state the doctrine empirically.

Theoretically, one ought to say that the movements of the organs of speech, called into being by the nerves, to produce the sounds of \(\rho \) and \(\hat{k} \), owing to the other sounds in their neighbourhood, gradually underwent deflection in the direction of the movement required to produce the spirants. The sensations that accompany these movements similarly underwent change, and also helped to reproduce in a succeeding movement an alteration that had taken place in a preceding. The stability acquired by these sensations, themselves one of the prime agents in producing change, induced in all other cases, with the aid of the sound-picture they had engraven on the memory, the production of said spirants from said breath, although the juxtaposition that initiated the change did not in these cases exist.

However doctrinaire this statement may read, it really is necessary in these matters to state precisely what happened, and how it happened. The cause of the change is local, and an inclination to follow established precedent has brought about the rest. The change did not—no change does—take place per salhum. There were intermediate halts. In this connexion. Mr. Sweet points out, in his

History of English Sounds, that spirancy must have been reached through intermediate aspiration, that t must have become b through th, otherwise that d would have become b.

With regard to the change from aspirate to voice if we take D', B', G', as correct representations of the so-called aspirates, and remember that Mr. Ellis discovered the aspiration to be a mere glottal buzz, what great difficulty does the deaspiration present. Place D', B', G', beside D. B. G. their Teutonic transmutations, and the change does not seem at all difficult, not so difficult, to follow Dr. Murray, as the change into the Greek breath aspirates. The buzz is simply dropped. If the old representation of the aspirates be insisted on, then between aspirate and voiced stop there must have intervened the voiced spirant. And one consideration seems to require the intervention. Would not otherwise the D that had been got from DH (D'), have shared the fate of original D, if aspirate into voice was the second change and prior to voice into breath. The last change, that from voice to breath, has sorely

puzzled many. It is said that the change is not along the line of ease in articulation, that unvoicing is a change from an easy to a harder sound. The masters in phonetic science seem to find no difficulty here. Sweet says that the change took place through whisper, and was more or less direct. It is well to remember that unvoicing did not here happen for the first time, but that the change that caused the voiced aspirates of Sanskrit to appear as breath aspirates in Greek, and breath spirants in Latin, is a conspicuous example of the same process.

It is well known, too, how prone Celts and Germans are to unvoice voiced sounds. This suggested to Professor March the hypothesis mentioned in his Anglo-Saxon Grammar, viz., that the invading Teutons were gradually influenced by the Celtic pronunciation of their own voiced sounds.

Assuming that the change is counter to the principle of case in articulation, though the change—say from d' the point-stop-voiced to t the point-stop-voiceless—does not seem a hard one, let us remember (we have it on Paul's authority) that case in articulation is quite a secondary and subordinate cause of change. Not that we are to dispense with euphony altogether, but let us not forget that euphony often offers an explanation that ignores the fact of the inter-nediate existence of numerous minute defections. It is not the last link in a chain that enables a junction to be effected between two different points, but the whole series including the last.

This would seem to be the place to refer to a suggestion thrown out by Mr. Conway in a recent number of the American Journal of Philology. We referred above to Mr. Sweet's statement that voice d became breath t through whisper. Well, certain facts in Italic orthography, such as the representation both of the voice and the breath by C up to the end of the fourth century n.c., the transitieration of depicts and the form and Bringes, the comparison of nullspike and gubernäre, have led Mr. Conway to the conclusion that the mediics and tenues were originally separated not as voice from breath, but as whisper from breath, of course these medie were afterwards voiced. This leads him to infer that the parent speech media were also whisperied. Whisper is that intermediate state between breath

and voice in which the vocal chords are approximated, but not vibrated. We thus get Mr. Sweet's intermediary to start with.

A few remarks now on the order of the changes present in Grimm's Law will form a necessary sequel to what has been said above of the character, of the scope, and of the production, of the changes. These will simply be an echo of what Brugmann says in his Grundriss. It is not to be supposed that processes referred to below, suddenly came into operation, for they doubtless were present in some shape and to some decree in the warent species.

To begin with, then, the tenues became spirants. The change first took place in the case of p and k before t and s, and was then extended. Next, or perhaps first, the tenues aspirate and the media aspirate passed, the first into the breath spirants, the second into the voice spirants. The tenues and the tenues aspirate thus fell together. This fact enables us to cognate Gothic haban with habeo, referring both to common root khabh-. The voice spirants were afterwards largely stopped into media, a process probably assisted by the fact that the voiced spirants after nasals, and r and I, became medice. Under the action of Verner's Law (to be referred to presently), the breath spirants that came from the tenues and the tenues aspirate. in certain surroundings became voiced spirants, afterwards largely medice. So that a media may be traced back to a tenuis, a tenuis aspirata, or a media aspirata. Finally, the medice passed into tenues. Before leaving this change, the following words of Mr. Sweet may fitly be appended: - A change such as that of d into t may begin at the end of a breath-group, and be then extended to the end of words within a breath-group, as in German; and finally to all the a's in the language, as when every Aryan a' became t in Germanic.' Let us remember in connection with the above remarks that processes got at by analysis perhaps did not function in actual development in the order given by analysis.

Sweet's order of change is different from Brugmann's. This is what he says:—'As regards the order of the changes, it is clear that ah could not have become a, till Ar. a had become t, and that this latter change could not have taken place till Ar. t itself had been modified—otherwise some two of the three must have run together. The changes must, therefore, have begun with that of t into b through th, at then taking the place of Ar. t, and, lastly, ah taking that of Ar. at.'

A few facts about isolated changes will complete the account of the first change. st. sp., th do not suffer change; ad passed into st—cp. mest and L. nidus (nizdo); sph and zdh into sg and zd—cp. A.S. mearg and Sk. majjd 'marrow,' Goth. mizdō, A.S. meard, and Gk. µwisk; maldh' 'reward'; ti (tith) into ss—cp. A.S. gewist and Gk. ioris (gitth), sometimes st, by analogical and other influences—cp. A.S. wäst, Goth. wdist, Teut. waiss, and Gk. iodes, Sk. včttha (the t is due to the analogy of Teutonic mah' thou mightest,' Sc.

Before passing on to the second change, it is worth our while to consider what testimony the runes may have to offer about the first change. Taylor tells us in his 'alphabet' that the d rune corresponds to the Gk. thin, the g rune, to the Gk. chi, and the k rune, probably to the Thracian gemma. This would seem to imply that, at the end of the runic period, the lattverschiebung was en train de te faire. It is now very generally believed that the runes were got directly or indirectly from Greek colonists on the Euxine, but as to the date of adoption differences exist. Taylor speaks of the sixth entury n.c., while Sweet says that the most probable date for their adoption is the third century inc. The first change, according to Sweet, took place some centuries before our era (but surely this requires a remoter date for the adoption of the runes than 300 n.c.); the second did not come into operation until at least five centuries after it.

The first remark to be made in connection with the H.G. changes is that they are comparatively recent. Words borrowed from the Latin, in common possession among the Teutons, suffered the letter-change, such as cannabis. O.H.G. hanaf 'hemp,' strata, O.H.G. strava, 'This proves that the change did not take place till connection with the living Latin of the Roman Empire had been cut off. Dr. Murray refers the second shifting to changes effected on German when adopted by a Slavonic race, Scherer, to Romance influence. But may it not have been a recrudescence, a partial repetition, very partial, it is true, of the first shifting, due to the phonic activity, possibly, of that section of the Teutons, the sound-development of which had dominated the race. If the changes of the first shifting are natural and omnipresent, why not allow their partial repetition. Voice to breath from I.E. to G.T. resembles . voice to breath from G.T. to H.G. In breath to aspirate. it is true, the H.G. aspirate that resulted from G.T. breath is quite different from the G.T. aspirate that resulted from

I.E. breath—the H.G. aspirates being surd affricates, or spirants, the G.T. only spirants.

In aspirate to voice from G.T. to H.G. the change, as will be seen by referring to the table, took place only in the case of dentals. The evidence for the law in fact reposes on the behaviour of the dentals. The mnemonic B.A.V. is evidenced only by dentals; A.V.B., best by dentals, occasionally by labials and gutturals; V.B.A. in the dental, as in the other positions, has only the evidence of spirants or surd affricates. Note, too, in this formula, that ch is archaic, and that there is no quite satisfactory example of the through representation of labials.

n∠¬V,
of change are from left to right, along BA, AV, and VB,
thus including German in Teutonic, noting specially the
second shift of the dentals.. The very partial character of
the II.G. change is thus quite evident, indeed, the changes
were only fulfilled with approximate completeness, in
Alemannic and Bawarian, spondically elsewhere. The one
change common to all the German dialects is that of th into
d. Of collocations that resist the second shift we have xt,
xt, xt. To these add tr, th, and ft.

It will now be possible to sum up the evidence on Grimm's Law. We have seen that the changes are not extravagant, that they have some claims to universality, that they did not spring into existence with gourd-like rapidity, that they had humble beginnings, being probably to some extent the extension of local effects. They existed too in embryo at the date of the parent speech, that is to say, there was not identify of spoken speech then, but those tribes whose language schibit the phenomens that Grimm's Law connotes, displayed then in their speech the beginnings of these idiosyncrasies. For does not Paul say 'We must therefore regard, as a rule, the independent languages which have developed out of a common original language as continuations of the dialects of the original language.'

This statement seems to involve the ideality and artificialness of a homogeneous parent speech, and there are many reasons for doubting the existence of such a parent speech. It is then much more correct to say that there was not homogeneity to begin with, than to say, as some do, that the sounds of a putative parent speech were nondescript in character, and potentially able to become all they ever afterwards became. What sort of reality could such mongrel sounds ever have possessed.

The changes, too, took place unconsciously. Let us remember that they were only accomplished after considerable intervals, and by means of numerous intermediaries, some of these doubtless long-lived. To postulate the series—sound to be changed, last intermediary, final result—and to assume along with this a clear consciousness of the process, does not seem scientific. To import into Grimm's. Law as an explanatory factor a volitional energy that makes for or against change, is to endow individuals with a prophetic consciousness of the phenomena in question, and a determination to bring them to pass. Two quotations from Paul will enforce this view. "There is no such

thing as a conscious effort made to prevent a sound-change.' And 'We must cling to the fundamental maxim that sounds are produced and taken cognisance of without any clear consciousness. This statement contradicts all such explanatory theories as presuppose in the minds of individuals an idea of the sound-system of a language, under which head come several hypotheses as to the German sound-shifting process.'

In the eleventh volume of Kuhn's Zeitschrift, Lottner tabulated two main classes of exceptions to the first lautverschiebung. In the first class were set together cognates like Sk. duhitar- Goth. dauhtar; Sk. band (Gk. wobspbg, . I. offendix), Goth. bindan; Sk. budh (Gk. iσυθόμην), Goth. binden 'command': L. gradus, Goth, grids 'step,' where thu d. b. and e of the Indo-Classical seem to remain in the Germanic. These exceptions were disposed of by Grassmann in the next volume of the same Zeitschrift, where he demonstrated the fact of the presence in the original language 'das gleichzeitige vorhandensein' of two aspirates, one of which has been lost by dissimilation. The roots of the above words should then with proper vowel denotation be written Jdhugh-, Jbhendh-, Jbhudh-, ./ghuredh-. The lautverschiebung is then seen to be regular.

To illustrate the second class of exceptions, place together by super-position-the following cognates:—

 Dentals have been chosen for illustration, but equations with other letters are available. Glancing at the equations,

raτήρ <u>πλυτός israτόν</u> vavrfimáhe (t pl. pf. ātm.) Goth. Iadar A.S. hlud Goth. hund wurdon (pl. pret.)

we see at once that we have in Germanic the voice stop d, instead of p. Greek words bearing the original accent have been selected, in order to bring out the facts in as homely a way as possible. It will be noticed that in every case the Greek cognates and the one Sanskritt cognate have the accent following the consonant affected by the lautverschiebung. It should be noticed also that the consonants in question are medial. The syllabification, too, has to be attended to. The f is considered to belong to the preceding syllable—"alle dem vocale folgenden consonanten gehörten der vorhergehenden silbe an." (Confer what Roby says on syllabification in his "Latin Grammar," p. 87, also in Preface to Grammar, p. hxoriv.). Contrast now

fadar with Goth.brobar.

The last two cognates exhibit the usual transmutation.

Coincident with this we notice that the accent precedes
the f. For a similar coincidence contrast

vavrimáhe with vářte (1 sing. pres. ātm.)
wurdon with weorŏe (1 sing. pres. ind.)

Here also the accent in the regular mutation precedes the \(\text{\chi}\) Is the position of the accent coincident or causal? Causal. In each of the Greek cognates of the exceptional Germanic words, the accent follows the \(t_i \) and in Sanskrit, the terminations of the perfect plural bear the accent. But \(p'\text{\chi}\text the final result gives us a voiced stop, i.e., t, p, k pass into d, h, g. Under the same conditions s passes into r. If the accent immediately preceded, the mutation is regular, i.e., t, p, k pass into th, f, h. Under the some conditions s remains. For example of b and g take

$$\frac{i\pi r\acute{\alpha}}{\text{Goth. } \vec{s}i\acute{
m b}un}$$
 and $A.S. \frac{i\pi v \rho \acute{\alpha}}{\text{sweger.}}$

This statement is Verner's Law, one of the acutest discoveries in linguistics, and most far-reaching in its results, first enunciated by Karl Verner in the twenty-third volume of Kuhn's Zeitschrift.

So much for the facts of the change, and the cause of the change, what about the modus operandi? Doubtless the t, p, k changed first into the breath spirants th, f, k; the vocalic surrounding vocalised these into the voiced spirants; these were afterwards stopped. Just as the law explains $\pi u \pi r p$ and f a d a r, and the Anglo-Saxon $g r a m m a t i s d r b e law explains <math>\pi u \pi r p$ and f a d a r, and the Anglo-Saxon $g r a m m a t i s d r b e law explains <math>\pi u \pi r p$ and $\pi u r b e law explains the plural <math>u u r d n d r$ seem in $\frac{c e a n}{c u r n}$ the singular and plural preterite of $\frac{c a n}{c n} r b e s n d r$ seem in $\frac{c e a}{c u r n}$ the singular and plural preterite of $\frac{c a n}{c n} r b e s n d r$ seem in $\frac{c e a}{c u r n}$ the singular and plural preterite of $\frac{c a n}{c n} r b e s n d r$ seem in $\frac{c e a}{c u r n}$ the singular and a plural preterite of $\frac{c a n}{c n} r b e s n d r$ seem in $\frac{c e a}{c u r n}$ the singular and the r n b e n d r u r e n r e n

For an example of the occurrence of spirant and voiced stop in modern German, take siehen gezogen, but sometimes, here, as in Gothic, the spirant is driven through as seihen gesiehen. Let me now give Verner's own words—'Indogerm. k, t, p gingen erst überall in k, th, f über; die so entstandenen tonlosen fricativæ, nebst der vom indogermanischen ererbten tonlosen fricativæ, wurden welter inlautend bei tönender nachbarschaft selbst tönend, erhielten sich aber als tonlose im nachkaute betonter silben.

Bugge has tried to extend the law to initial consonants. For example, the cognates communis lead him to infer that, when the accent follows at a distance of not less than two syllables, the ar ambies.

sylatones, the saw applies.

It is the fact, then, of the position of the consonant in the accented syllable (to adopt Verner's syllabification) of bripler (spekers), that prevents the passage of the th into d, as in the case of suries fadier. What then was the nature of the accent? Was't one of pitch (?) like the primitive accent, or one of stress also. Verner says of stress also —'nicht länger rein chromatisch sondern zugleich exspinatorisch.'

The free accent of the parent speech must, however, have been operative, and have done its work, after the commencement of the first shift, otherwise the Teutonic accent proper, that on the stem-syllable, would have prevented the shifting into stops.

It may be asked here why the English father and worker have th. This used to be attributed to Scandinavian influence, or to the analogy of brother, but Dr. Joseph Wright, in the Academy for March 3rd, 1888, quotes many examples to prove that A.S. d became voiced th through the influence of following r (cp. Chap. IX, under d).

Before closing this chapter, a reference to some of the applications or extensions of Verner's Law will not be out

of place.* In his book, 'Verner's Law in Italy,' Mr. Conway successfully applies the principle of Verner's Law to explain the absence of rhotacism in certain Latin words. One felt in a vague sort of way that ásinus, caésaries (here the initial accent was kept till the law was dead), vāsum, beside géneris, gerébam, Aurélius, presented an unexplained contradiction. With Mr. Conway's explanation the seeming contradiction disappears, and law obtains. This explanation runs as follows:--Wherever, medially, in Italic, an s between two vowels followed an unaccented syllable, the final result gave s in the non-rhotacising dialects, such as Oscan, and r (through z) in the rhotacising dialects, such as Latin and Umbrian; if the accent immediately preceded, the s was kept, save in Latin and Faliscan, where the change into r took place even then, if i or ufollowed the s, and the same vowels, or a long vowel or diphthong, preceded-e.g. náris. This rule explains everything in the words quoted above. There are exceptions to the rule, however, such as ctira, following the analogy of curâre, dáre, that of its compounds, and eram, which was probably enclitic and without accent. See also page 54.

* Dr. Fennell (Indo-European Vowel System, a pamphlet well deserving careful perusul) attributes the result d'in βadar to the fact that it ends a syllable. It is the initial letter of a syllable (If suppose Bugge is thrown) that shews the regular change, and for the reason that it is initial. Verner would have said that the t of φράτηρ changes regularly because it is in the accented syllable, Fennell says that it so changes because it begins the next syllable. He lays down the proposition that an accented syllable was weighted as lightly as possible with consonants. On this proposition the t of φράτηρ begins the second, and the t of πατήρ ends the first syllable of their respective words. In Verner's syllabification both t's ended first syllables, one accented and one not. Mr. J. H. Moulton in Vol. VIII. of the American Journal of Philology applied the principle of Verner's Law to explain the presence of a tenuis in Greek, where one would have expected a hard aspirate. In his own words:—'Original hard aspirates lose their aspiration in Greek except where the accent immediately precedea.' Take for examples John and ieri (Sk. sthd), the I.E. superlative suffix this seen in Sk. thd and +ie; Sk. mithds and µsec (A.S. med). It will be seen that where the accent follows, the tenuis appears. Sentence-accent too has contributed examples, i.e., the

immediately preceding accent that preserved aspiration might, in the case of initial aspirates not accented on the root, be got from a preceding oxytone. This occurrence might be frequent enough to give rise to doublets—to a exdue to the action of a preceding oxytone in the sentence-life of the word, alongside of the ex of the rule. In many cases, the aspirated form obtained the wider extension, might-even, under the operation of levelling 'ausgleichung,' obliterate all traces of the form with the tenuis.

Next, we have Slover's Law, to the effect that a g occurring before w in an unancented syllable disappeared—e.g., A.S. gestons for geseguid, Goth. masui' maid' for magui, Magus however for maguids, because, to quote Mr. Sweet, 'in an early stage of Germanic in which Aryan o was still preserved, as well as Aryan 's, u', in, the u was dropped before these round vowels, but kept before a, i, e.'

There is also an alternation of c and g mentioned in the History of English Sounds, which may possibly be due to nasal action together with a varying accent. Compare sizen, sigan, 'suck'; and wising 'pirate,' wig 'war' (L. vincere). In this last, the nasal seen in the Latin, would voice the c into g in an unaccented syllable. Note also in this connection mendar and mentar

Paul and Kinge's Law covers another class of exceptions of Grimm's Law, viz., those in which gg, dd, bb got from Lie, gian, gibra, dian, bhin, or, by Verner's Law, from kn, i'rn, ia, pra, or from original mediac followed by n, with accent following, become kk, it, pp. For illustration, rare the process by which A.S. smace has been reached—L.E. small'sab-into numbrid, smacrad (by Verner's Law), smagged (by assimilation), smalkkd. It is this last act that exemplifies Paul and Kinge's Law. The o in smace is due to a-unital. If the accent had preceded the L.E. k, the result would of course have been the

CHAPTER VIII.

Sound Relations in English—Introduction and Short Vowels.

The Anglo-Saxon alphabet was got from the British Celts.
These of course used the Latin Alphabet, into the writing

of which they had introduced certain modifications. Anglo-Saxon text books are now usually printed with modern

characters, but any one who cares to gain a knowledge of the look of the hold script may get this by looking into, say, Thorpe's edition of Alfred's Orosius. The making of the letters a, f, g, r, s, t, is quite noticeable. The Modern Irish Alphabet of eighteen letters presents, so far as it goes, a very similar appearance. The Anglo-Saxon letters, using the ordinary with two supplementary characters, are: a, a; s, f, o, n, y-b, c, d, b, f, g, h, l, m, n, h, r, s, t, h, m, a.

I (thorn) is taken from the runic alphabet. <math>b is an anaipulation of the character for d, to express the sound of d in then, but the MSS, use this and the previous character to express both sounds of the English dh, either that in then, or that in thing. It may be worth while mentioning that in the oldest texts (as now), d denoted both sounds. In some books another runic character (ab T h)

is used for the sound expressed by w. The A.S. 5 is sometimes retained in preference to g. Sometimes k is written in the MSS. for c, and for the usual aw (w), the Latin symbol gw sometimes appears. The letter z is rare in Anglo-Saon. It sometimes represents the sound of to, and in foreign names perhaps had the value of GR. \(\(\) i.e., \(d \).

Anglo Saon.

It sometimes the value of a (low-front-wide) in the word mean (English, not Scotch). \(y \) retained the value of GR. upvillon (high-front-narrow-round). This sound had already as afterwards took place in English through unrounding) in Old High German been confused with \(L \) chad always the hard sound (two varieties, but not an s-cound). Unflustic sometimes written as \(c \). Further remarks on the sounds expressed by these letters will be made later on. See also passim in Chaps, VIII. and IX.

There are dialects in Anglo-Saxon which often exhibit differences in spelling, differences that have to be noted, because some one of them, rather than its dialectical neighbours, may have given rise to the present English form. The chief' dialects are the Northmbrian, the Mercian, and the West-Saxon. The language-area occupied by these dialects reached from the Forth on the north to the English Channel on the south, and may be said to have had for dividing-lines the Humber and the Thames. Mercian occupied the district between these two rivers, and marched on the north with Northumbrian and on the south with West-Saxon. Anglian is a common name for Northumbrian and Mercian. The Middle English dislates—Northern, Midland, and Southern—corresponded in the main, both dialectically and

Southern—corresponded in the main, both dialectically and geographically, to the older dialects. The Southern dialect hears strong traces of Midland influence. In both the Anglo-Saxon and Middle Reglish periods, there existed another sufficiently distinctive variety of the language, to which the name Kentish has been given.

Middle English may be said to begin with the year 1150,

and any be said to begin with the join 1.30

and to end with the year 1450. Both before and after this interval, a considerable time—a century before, and half a century after—must be allowed for the transition from Anglo-Saxon to Middle English, and for the transition from Middle English to Modern English. The latter then, begins with the year 1500. Mr Sweet makes it extend over three stages of development, to the year 1500, from which point he dates the beginning of Living English.

Middle English is a slow, self-contained, and natural development out of Anglo-Saxon. It seems, in that case, all the more needful to answer a question that is naturally suggested by the date assigned above to the commencement of the language. That question is—what influence had the Norman-French of the victors on the language? None, we have just said, on its linguistic development. On its vocabulary and orthography, a very great influence indeed. The vocabulary does not exactly concern the subject of this chapter. Suffice it to say that it was not till a well on in the thirteenth century that foreign words were introduced in large numbers, the busiest time being the interval between 1:250 and 1:350. Of the influence exerted on the orthography, more presently.

A sentence or two to record the main varieties in the Anglo-Saxon dialects.

In the Anglian dialect, the ϱ that interchanged with a in Anglo-Saxon before measts is preferred to the a. For West Saxon a, e is found in Mercian (and Kentish). There a means a. The a of West-Saxon that equals Teut, \bar{a} (Goth. a, O.H.G. a) is represented in Anglian and Kentish by \bar{c} . For aa before I and a consonant, a (probably long) occurs universally in Anglian. For aa before r and r g, e appears

in Anglian. Northumbrian may have a. ea before h. x. and ht, appears in Anglian as a. For the W.S. as that denoted the result brought about by the development of a glide-vowel between the fronts c and g and the following o, there appears in the non-W.S. dialects the aforesaid a -gof (W.S. geaf). Compare the appearance in a similar surrounding of non-W.S. gefon for W.S. geafon. The symbol ea is however found in Mercian as u-(or o-)mutation of a. and in Northumbrian as o- (or a-) mutation of e (W.S. eo). In Anglian, ca before 4. g. h. is reduced to c. co before h. rc, rg, rh, is reduced to e, & before c, g, h, to ē. These sounds are often left unmutated. For the W.S. ie. e appears in Anglian and Kentish, and for ie, e. a the mutation of a, and a the mutation of a, appear in Northumbrian and Kentish, the & in Mercian as well. These are unrounded in West-Saxon to e and &

Of the Middle English dialects, the Midland is the most important, and of its varieties, that variety which is called East Midland. This coloured by the Southern dialect is the source of standard Modern English.

The differences between the Southern and East Midland varieties of Middle English can be shortly shewn.

The Southern ρ before nasals is unrounded in East Midland to a. The ρ , with sound of A.S. α (1. f. w), under which the A.S. α and α had in Middle English been levelled, is represented in East Midland by α . The A.S. $\tilde{\alpha}$ which was unrounded to $\tilde{\rho}$ in Southern is retained unchanged in East Midland. Southern ω and $\tilde{\omega}$ are represented in East Midland by the reductions ϵ , as well as by the digraphs. Both Southern and East Midland represent A.S. $\tilde{\alpha}$ by $\tilde{\rho}$. A.S. ρ and ρ are unrounded in East Midland to i and i, while in Southern they are represented by u, \bar{u} . The Kentish of both the Anglo-Saxon and Middle English periods represents \bar{f} by ℓ . It is to be noted that the same dialect represents A.S. ac ac, short and long, by $\bar{g}a$ yc. Chaucer uses the letters that have been given above to East Midland, but has the \bar{g} (rounded \bar{a}) of Southern.

To return now to French influence on Middle English orthography.

After 1400, Anglo-French was dead as a spoken language. Its teaching, had been stopped in schools, as Trevisa tells us, in 1385.

Some space will be needed to note the great influence exerted by Anglo-French on the orthography of Middle English.

It is convenient here to notice, in regard to handwriting, that the Anglo-Saxon forms for the \$d_f, \(\frac{1}{6}, \text{r}, \text{s}, \frac{1}{6}, \text{d} \) the Celtic Român alphabet were ousted by the forms of the French hand. Mr Sweet, in writing of the change wrought on English orthography by Norman-French influence, says that it amounted to the introduction of a totally new orthographical basis, shaped and confined of course by the existing orthography. Certain facts will be adduced to bear this out. Yowels first.

A.S. α (A.S. α was levelled under this letter), under Anglo-French influence, is expressed in the Southern dialect by α . The α (and α), that vulgar Latin transmitted to French, had been levelled under α . The Ormulum keeps the symbol α , but with the value α . The short α is in this text written α .

Under the influence of Anglo-French, in which is (i'ee)

had been reduced to (ee), the same symbol ie (ye) came to connote the sound (ee), and is used in late Middle English to represent this sound (close ê), not only in French words like metchief, but also in English words, e.g. Chaucer's lief (also leef) (A.S. lef).

is, later on in Middle English, written as y, a symbol, which in French writing was convertible with i. The y is very common in the neighbourhood of n, m, u, w, and at the beginning and end of words. The possible confusion in form is sometimes avoided in the case of initial i by writing it as a capital.

In Chaucer y appears for I.

The writing of the diphthongs at and et as ay and ey should also be noticed.

u, after the French manner, is sometimes written as o, in the neighbourhood of letters that have a like form, vix, u (consonantal), u, m, w. Initially the confusion could be avoided by writing u is v.

In late Middle English, o was also written for u, when a consonant + vowel followed.

Latin u (and δ —a close sound in Latin) had in French passed into a sound between (u) and (o), which was then written u or o (close), though o afterwards prevailed. There was also in French an open o, coming from Latin δ (and an).

The long u-sound is, owing to the said influence, quite widely written in late Middle English as ou, a symbol which in French had put off its dipthongic sound, and taken on that of (uu). This sound follows the development that native words in ü exhibit—A.S. hūs, M.E. hous, Mod. E. house (an). Anglo-French influence caused A.S. y f to be written as u in the Southern dialect. f is sometimes written ui, and later on, uy.

The Ormulum for A.S. y f has i i. The A.S. y had been pretty generally unrounded, save in the Southern dialect.

w and 5 (front-open) were used in the Ormulum as diphthongic signs (after short vowels written unw, 55) to represent the second element of diphthongs. These are afterwards

replaced by Latin and French u, i.

w however again got vogue as diphthongic element after

back vowels (a, o, u)—M.E. drawen (A.S. dragan, Ormulum drazhenn (zh = back open)).

Consonantal orthography suffered greater changes than

vocalic.

The back c of Anglo-Saxon is written k before c and t. The Ormulum has k also before a. c is retained before o and d, and before consonants, but the Ancren Riwle often has k before o and u, and before consonants, save v.

c has, in more modern times, ousted & initially, before

The disuse of c is owing to the fact that c before e and f suggested to a French scribe the sound of s. Later on in Middle English, c is used to denote an s-sound. Earlier, it

Middle English, c is used to denote an s-sound. Earlier, it had been used with old Anglo-French value of ts. sc was written as sch.

The same symbol, however, sometimes had the value sk—sclaundre, sklaundre (slander—scl is now disused), and represented that sound, except before e, i, y.

ss is, both in French and English, written ss, a combination which in Anglo-French had a ss- or s-sound—lescün, blescien. For cus, qu, a symbol sometimes used in the Anglo-Saxon period, ultimately prevailed.

Front c was in Middle English ultimately written with the French symbol ch. Its doubling was written och or cheh.

b, which had prevailed over the alternating 8 and 9 of the Anglo-Saxon script, was now by the action of French scribes replaced by th, which, as we saw, was not unknown in the Anglo-Saxon period.

f, which in the Anglo-Saxon stood for both breath and voice sound, remains in the Ormulum, but the Ancren Riwle, with its strong traces of the influence of the foreign spelling, has consonantal u (v) medially, and sometimes initially. Finally, and before voiced consonants f is retained. Had u been written here, it would with the preceding wowled have looked a diphthtong.

Latin v had in French lost its w-sound, and taken on the voiced sound of f. In Chaucer, f expresses the v-sound only in of.

 The French g now takes the place of the A.S. 5 (a sorely burdened letter), as the symbol of the stop consonant. It also represents French soft g.

3 (its graphic descendant) is retained to express its own open sounds.

French soft g when initial is usually written f.

ge and gge represent the f- and jj- sounds when final.

For the front-open g take as example from Ormulum—

Sung.

'In the same text, back-open g is written 5h-foll3heun This symbol in the Southern dialect appears as h.

Some East Midland texts use g rather than 5.

Later on in Middle English, consonantal v can replace 5.

The hard g is sometimes represented late in the fifteenth

century, both in French and English words, by gu, which had lost its after-sound in later Anglo-French.

A had a back and front variety (initially it had been weakened to a simple breath). For both of these sounds it is retained in Aliddle English. At was sometimes used, but owing to confusion with A.F. Ab, went out of vogue. Later on, French seribes refusing to endow this symbols, weak in their own tongue, with such power, use other symbols g is used and also 3. In the Northern dialect, in addition to these, Ab came into fashion. This passed to the South and is common in Chaucer.

Front gh changes into y before a vowel—hise (also written hie).

Back gh (usually preceded by u, which is sometimes dropped after o) often falls out before a vowel—ynaugh, ynawer (plu.). Both the front and back variety may drop, finally, and before t.

A.F. z is sometimes written for voiced s. The symbol s' stood in Anglo-Saxon and Middle English for both breath and voice sound.

The earlier value of A.F. z, viz., ts, also appears in the combination nz, remaining down to Chaucer, e.g., vestimenz.

The Anglo-Saxon rune-symbol for w, used in the Ormulum and the Ancren Riwle, is replaced by the French symbol w, the product of two v's with value of u.

Consonantal y has arisen, says Mr Sweet, from the habit that scribes had in later Anglo-French of writing y initially for i (j).

Before leaving Middle English atthography something

Before leaving Middle English orthography, something should be said about Orm's spelling. To denote shortness of the preceding vowel, every consonant that was final, or followed by another consonant, was doubled. If the consonant were followed by a wowel, the doubling did not take place, for then, an air of reality would have been bestowed on the word, and confusion with real words would have chaused. In such words Orm often used marks, the short mark for short wowls, and an accent for long.

It is a fact that in Modern English a final consonant is long after a stressed short vowel, and short after a stressed long wowel. Englishmen have a difficulty in reproducing the short consonant that follows a stressed short vowel in foreign words.

Not that Orm's spelling indicated real consonant length, for he uses it in syllables that have no stress. It was a mere device to indicate quantity, possibly suggested by existing fir-ty, though, as we have seen, in Orm's day, a short work before a consonant and worked could retain its shortness.

The presence of final doubled consonants began to be considered a sign of shortness of vowel, and vice versa, that of single consonants, as a sign of length.

It should be added that final consonants in Middle English (as in Modern English) were pronounced long after a short vowel, whether written double or not.

The loss of final e which began in Chaucer's time, and was completely generalised by the middle of the fifteenth century, gave birth to many types of words with short vowels, followed finally by two consonants—lesse into less.

Moreover, long vowels were regularly shortened in Middle English before two consonants (except before certain lengthening combinations—for which, see below).

Thus it came to pass that in an accented syllable two consonants came to argue shortness of vowel. Of course in unstressed syllables consonants were shortened both in Anglo-Saxon and Middle English—A.S. IVIsten(n)es, M.E. sünful(I)e.

Original single consonants were also sometimes doubled between vowels in Middle English—summe plu. of sum 'some,' wunnunge 'dwelling.'

It was to be expected that many words with short vowel and single consonant in Middle English would tack on another. This is so—pepper, penny (M.E. peper, A.S. piper—M.E. peny, A.S. penig).

Even in Anglo-Saxon, c, t, p, h, after a short vowel, appeared sometimes doubled before r and l-bitter, acppel.

Sometimes the doubled consonant of the pronunciation appeared in writing in the inflexions — God, Goddes (Chaucer).

Length of vowel was sometimes indicated in Anglo-Saxon by a doubling of wowel (or by accent). This practice gained ground in late Middle English, and is quite common in Chaucer, especially in monosyllables. i and u

In Modern English, final e is a sign of a preceding long vowel. This result has been produced quite fortuitously. The weathering that attacked the Anglo-Saxon unstressed endings often evolved a form containing an original long vowel followed by a consonant and the levelled e-ending —strike (M.E. striken, A.S. stricas). The name type of words, in which an original short vowel became lengthened in Middle English before a consonant and vowel (see below), presented similar forms. The howe type of words (A.S. his —the d was rounded in Middle English to d), in which there was originally no e in the nominative, suffered con-

tamination in form with the dissyllabic cases (especially the dative), where the long vowel was not written doubled, and took on in a

At this time the levelled cendings of the unstressed syllabler were on the road to mute endings. This progress had already been completed in Northumbrian, and may to a certain extent be regarded as a Gallicism, the French of that dry presenting many examples of &r that had become mute. The word-types in which sites if faul c hampened to

occur along with a long vowel were generalised, and a function foreign to the ϵ was fatuously fathered on it.

The use of final ϵ was somewhat wild. It was used after

short vowels—Apme'him.'

It does not indicate length of vowel after v—live, love.

The e in these words is a graphic necessity. When v
(consonantal u) was written u. its appearance after a vowel

would have led to confusion with diphthongic combinations. We have discarded e in many words where it did not indicate length, or was not needed for that purpose—reome, electre, thautle. At the beginning of the Modern Period, final e could also denote length after two consonants—e-h/de.

A few supplementary remarks on the general orthography of Middle English and Modern English will now be made. Early in the Middle English period hr, hl, hn passed into r,

1, n. The spellings rh, bh, and nh, are also found in early texts. hrv however, retained the order of its letters, but even in the Ormulun, nth occurs, proving that the present English pronunciation of a breath nt, was then in existence.

In the Northumbrian dialect the h of the hw was individualised to such an extent that the aspirated labial really became a labialised guttural, expressed by qu quh, which sounds may be seen written in Scotch proper names, and still heard from Scotch lips in certain parts of Scotland.

The prefix ge- was represented by i-, as early as the tenth century.

ai and an were often written ay and aw, when followed by a vowel, or at the end of a word.

w was sometimes written for u-hu, hw, hou (A.S. hū).

Somewhere in the fifteenth century, j and v, formerly mere graphic varieties of i and u, began to be set apart for the consonantal function of these letters. To begin with, they were used initially. v had already been employed initially in Chaucer.

The letter 5 passed out of use. Its form had become too like that of z, in fact it is actually written z in old Scotch writing—seir for year.

Compare the confusion between \(\) and \(\text{y}. \) In Grafton's Bible of 1540, these letters are formed exactly alike.

sch passed into sh. ssh was reduced to the same symbol.

Doubled k is expressed by ck.

In several words gh is used for hard g—ghost, gherkin.

In several words gh is used for hard g-ghost, gherkin.

Spenser has ghess (guess). gh expresses hard g in Italian before e and i.

The M.E. cch (chch) is sometimes written tch, and M.E. gge is written dge—stretch (M.E. streechen), hedge (M.E. hegge). Spenser has ritch for rich.

At the beginning of the Modern Period, y became almost convertible with i. y was preferred finally. Final i also assumed the form ie. Later on, y was expelled from many places.

In latter-day English, spelling and speaking have become quite divorced, and the estrangement is bound to widen, so long as the spelling is held sacred. We have in fact twolanguages, one for the eye, and one for the ear. The symbols of the former are arbitrary, without the advantage of being consistent. Speak as you spell, and spell as you speak, are not exactly counsels of perfection in English.

There must next be given a list of words to illustrate the passage of A.S. vowel-sounds through Middle English into Modern English. These are of course selected from Mr. Sweet's great work.

In the first column, the Anglo-Saxon (West Saxon, Anglian) word is given, in the second and third, the Middle English and Modern English equivalents. The sounds are taken in this order of Anglo-Saxon vowels—a (æ, q, ea), e (eo), i, o, u, y; ā, ē, ē, êa, éo, i, ō, ū, ŷ. They are then divided out into the living English sounds that derive from them, with subdivisions according to the spelling.

The following is a table of living English sounds, with the symbols to be used in classification. The slight sketch of Phonetics inserted further on will explain the terminology of the definitions and explanations.

```
v (m. b. n.) come.
                                   et (m. f. w. + h. f. w.) they.
                                    ou (m. b. w. r.+same, rounded)
e (m. m. w.) -dom.
1 (h. f. w.) fill.
                                     know.
e (m. f. w.) men.
                                    ii (h. f. w., diphthongic) feel.
20 (l. f. w.) man.
                                    uu (h. b. w. r., diphthongic) soon.
u (h. b. w. r.) full.
                                    yuu hue.
                                    ie (h. f. w.+m. w.) fear.
o (l. b. w. r.) not.
ee (1. m. n.) bird.
                                    äe (l. f. n.+m. m. w.) fare.
ai (m. m. w. +h. f. w.) high.
                                    ue h. b. w. r.+m. m. w.) moor.
ate hire.
                                    yuə your.
                                   20 (l. b. n. r.+m. m. w.) gore.
au (l. m. w.+m. m. w. r.) how.
                                    aa (m. b. w.) far.
aue our.
                                   00 (l. b. n. r.) fall.
oi (m. b. w. r. +h. f. w.) boil.
   Doubling means length. The symbol plus the definition
```

ought to make the sound clear.

The sounds defined are those of living English. The

Scotch, Irish, American, and even North English sounds are not always the same.

au—In Scotch, the first element is the mid-back-narrow. ii—In Scotch, Irish, and American English, the vowel is still a long monophthong, and narrow.

el—Scotch here has not a diphthong, but the long mid-

Re—This sound only occurs before r. In Scotch the r is of course trilled, and the vowel is long mid-front-narrow.

uu—In Scotch, North English, Irish, and American English, the old long monophthongic high-back-narrowround is kept. Compare the English and Scotch pronunciation of two or too.

ou—Scotch has the old non-diphthongic mid-back-narrow-round.

sa-In Scotch, this vowel is generally long mid-backwide round.

w—The full back vowel is heard in the West of England, and in Scotland. The ordinary English sound is rather fronted.

e-In Scotch and North English, the e in men is low- : front-wide.

se-Scotch man has the low-back-wide.

u-Scotch book has the high-back-narrow-round.

o—In Scotch, this sound is usually represented by the mid-back-wide-round.

By Scotch is meant the Scotch pronunciation of English.

The vernacular word may have quite a different sound,
e.g., the vernacular buik has the mid-front-narrow-round.

To save reiteration further on it will be well to set down

here some of the principles that regulate lengthening and shortening in Angle-Saxon and Middle English

There were in the Anglo-Saxon (chiefly in late West-Saxon and Anglian) certain consonant groups before which vowels were often lengthened. These groups were composed of r_1 , t_m , n_n and certain succeeding consonants. Short vowels, followed by unstressed stillables, were also

sometimes lengthened. This was much more pronounced in Middle English.

Monosyllables ending in a stressed vowel were regularly lengthened— $m\tilde{e}$, $\tilde{v}\tilde{e}$, $\tilde{e}\tilde{e}$, $h\tilde{e}$, $s\tilde{e}$.

Many monosyllables ending in a single consonant are also found long—\(\tilde{\eta}\), \(\tilde{o}\), \(\tilde{o}\), \(\tilde{o}\), \(\tilde{i}\), \(\tilde{i}\), \(\tilde{i}\), \(\tilde{v}\), \(\tilde{i}\), \(\tilde{w}\), \(\tilde{i}\), \(\tilde{w}\), \(\tilde{i}\), \(\tilde{v}\), \(\tilde{v

On the questioning of shortening before two consonants, as in Middle English (see below), the evidence is uncertain. The vowels of the unstressed elements of compounds very

often kept quantity, döm and hād always.

Vowels in final and derivative syllables were often short-

ened.

In Middle English, short vowels in accented syllables were lengthened before a consonant followed by a vowel. i and u did not take on length.

Monosyllables kept their short vowels. These in certain cases were lengthened, owing to the influence of inflectional forms, which, with their additional vowel, came under the scope of the above rule. Several nouns, for instance, borrowed a vowel from their oblique cases and got lengthening, or borrowed, it may be, lengthening and vowel together.)

Certain preterites of one syllable—yaf, shak, brak, &c., afterwards conformed to the rule (gave, spake, brake), assum-

ing the long vowel of the related forms that got lengthened by the operation of said rule.

The rule is sometimes inoperative, when the single consonant is followed by $-\epsilon r$, $-\epsilon r$, $-\epsilon n$, $-\epsilon n_g$, $-\epsilon r$. These are called the back-shortening terminations. Shortness for example is retained in the following words—faker, sadel, sewn, kering, kokl. Perhaps, in certain words, the inflected forms that, owing to syncope of their vowels, did not come under the above rule, influenced the nominatives. Some of these exceptions will occur hereafter.

The rule obtained, in spite of the usual shortening syllables, in aker, taper, oner, eradel, euen. Compare these as to sound with the previous exceptions.

It is also to be noticed that the $-\epsilon r$, $-\epsilon t$, &c., may not only nullify the action of the lengthening rule, but do actually sometimes shorten a preceding long vowel (cp. *father*, *sorry*).

Before two consonants, vowels are regularly shortened in Middle English.

Just as in Anglo-Saxon, however, there were certain consonant-combinations that often lengthened the preceding vowel. The second consonant had to be a sonant, and not every combination of r, l, m, n and sonant was effective. Examples are, börd 'board,' kāld 'cold,' fālde' 'told,' fālde' 'told,' fālde'.

The terminations that conserved shortness, and interfered with the action of the consonant+vowel rule, gave pause also in the consonant-combination rule.

There were also some pure exceptions—shollde and wollde (from the Ormulum).

Before ng, which perhaps had suffered simplification of sound, original shortness had been recovered. The spelling o (for short u), found in rong, tonge, proves this. The

form $yann_{\alpha}^{\alpha}$ has preserved in writing the symbol for long u, vi.e., on, or, it may be, borrowed it from youth.

So also the vowel before mb got back shortness as in dumb.

Just as much phonetics as is necessary for the understanding of the word-lists will now be given.

The breath that passes from the lungs into the upper passages may either pass freely and retain its quality, or, by thrumming on the vocal chords that close the glottis, be changed into voice. Vowels have to do with voice, consonants with both breath and voice.

A table of vowel-sounds is first set down. These are produced by the voiced breath that is freely projected into the differently disposed resonance-chamber of the mouth.

The following are the definitions of the terms used in their description:—(a) \(\tilde{M}_0 \), \(mid, \) \(\tilde{bow}\)—these denote the various positions of the articulating tongue; (b) \(\tilde{bout}_0 \), \(mix_{obs} \), \(mix_obs \), \(mi

Occasionally, in this and the following chapter, the action of sound-processes will be described by verbs—rounded, backed, frunted, &c.—the meanings of which repose on the definitions of the above terms.

Bell's names for the vowels are primary and wide. His explanation of these terms differs from the foregoing (Sweet's). He states that wide vowels differ from narraw in that they 'have an additional expansion of the soft palate, enlarging the back cavity of the mouth.

VOWEL-SOUNDS	high-lead marrow high-lack wise high-mixel-wide S78. F. finity Fr. finit G. birne (Grag)	mud-front Fr. Ast G. see (25 or, blod, st. Bell says that the high-mixed-narrow is heard in American sir and her.

An idea of the high-back-wide may be got by pronouncing the u in full, and at the same time forcing asunder the lips with finger and thumb. Bell says that the unaccented ou in -tious has this sound.

Low-front-wide-round—Bell says that this is heard in the Cockney about.

Mid-mixed-narrow-round-Heard, says Bell, in Yorkshire come, and Irish Dublin.

Low-mixed-narrow-round—In Irish her, sir, stir (Bell).

Low-mixed-wide-round—Regular sound of Irish short o in not, gone, &c. (Bell).

Consonant-sounds are produced by the voiced or voiceless breath that is projected upwards, and impeded or stopped at some part of the throat or mouth. The simplest consonant is the throat sound, the aspirate \hbar .

In uttering consonants, the sound passage may be (1) clear, and the result be gens sounds (2) blocked in the centre, and the result be side sounds (3) blocked altogether, and the result be stabe sounds (4) blocked altogether, with free nose-passage, and the result be neared sounds.

The parts of the tongue, &c., active in the articulation of consonants (i.e. in the partial or complete stoppage of sound) are sufficiently indicated by the names at the top of each column. Front means the middle of the tongue; point, the tip; and binds, the part behind the point; Madepoint indicates that variety of consonant-sound in which the blade-action is accompanied by a raising of the point of the tongue; jib-hacks have a closer approximation of the lips than the ijb consonants, accompanied by a heightening of the back of the tongue.

Here follows a list of consonant-sounds with noticeable examples.

CONSONANT:SOUNDS. BREATH.

Nasal.	STOP	SIDE	OPEN		NASAL	STOP	SIDE	OPEN .

Bell's account differs from the above (Sweet's) in analysis and nomenclature. For side and stop he uses divided and statut. He has wile, h_s , $s(u_s, h_s, h_s)$, in a row by themselves, with the name mixed. This term describes a narrowing of the sound passage, brought about by a raising of the front part of the tongue, or, in the case of the lip-sounds, by a contraction of the back part of the mouth. He places f(v) in his divided row, and classes th (dh) as a member of a mixed-divided row.

Glides are the parasitic sounds that arise in the passage from one sound-position to another.

It is now time to give the lists of typical examples of sound-change referred to above.

a, a, g, as: A.S. (i.e. West Saxon) a, representing Teutonic a (I.E. a, a, and indeterminate wowel a), is not a particularly common sound. It occurs in open syllables that are followed either by the back vowels a, a, or u, as faran but farest, dagum, dat plu. of dag, dages, or by front vowels that have developed out of original back vowels, as havele 'cloak' (Goth. hakuli), macian 'make' (Teutonic stem-zije). In close syllables it generally gives place to its substitute a.

The *i*-umlaut of a is ϵ (m. f. w.).

Before nasals, especially in Anglian dialects, a was rounded into ϱ . Both letters were however written, although later on, the a-sound seems to have prevailed in West Saxon. a-remains in unstressed words like an (cp. ag, with a) before following lip consonant).

 α replaces α in close syllables before a group of consonants, and before final consonants (save m, n, h, w).

There are exceptions such as habban 'have,' assa 'ass,' ac 'but.' Analogy conserves a in the imperatives of certain strong verbs, e.g. far 'go,' sac 'dispute.'

e is sometimes written for umlaut e.

In open syllables a may occur in syllables that were originally close—acer (Goth. acrs); in syllables followed by an e that is original, and not weakened from a, o, or u—dexes, gen. of deg; or even in syllables followed by an unoriginal c, if that e is (or was) in its turn followed by a syllable containing i—aceting in oble.'

æ is also a dialectic variation for the æ and eæ of other dialects—Mercian dægas (W.S. dægas), North. ære (W.S. eare), North. and Mercian gesæh 'saw' (W.S. geseah).

ca is the breaking of a. This result is given before final h, and h followed by a consonant (x equalling h), before r followed by a consonant, and often before / followed by a consonant. In this last case a is common enough in older texts, and occurs in Mercian — Mercian fullan (W.S. featlers).

ca sometimes occurs for a in poetry and dialect, when the following syllable contains u (o), e.g. waru 'care,' yatu, plu, of wat 'care,'

ca is also a dialectic variation for co.

In the ca that follows the palatals g, c, se (geaf, ceaster, secal) the c is a graphic means of indicating the preceding palatalisation. The vowel is really a.

A.S. a was the low-back-wide, a the low-front-wide, g the low-back-wide-round, and ca low-front-wide + low-backwide.

In Middle English A.S. α and ca were levelled under α . This sound was written e (ea), but retained its former value (l. f. w.). Later on it was very widely changed into a, but survived in the Kentish dialect.

g was pretty generally unrounded to a in Middle English, but appears in certain words where the sound had been group-lengthened. Notice also from. of, and on.

The α of Middle English, representing A.S. α , α , $\epsilon \alpha$, and Anglian α that had not undergone breaking, and certain shortenings of A.S. α ($\bar{\alpha}\alpha$, $\bar{\alpha}$), passed early in the Modern English period into (α).

The lengthened a of Middle English gives of course (al) in Modern English. The passage has been through fronting, raising, narrowing, and diphthongisation, with divergence of first element.

The influence of neighbouring sounds, parasitic development, dialectic survival, the action of analogy, and special modern lengthenings have all contributed to produce various results. These factors of change are seen at work in the following examples:—

A.S. a (m, o, ea).

among—The (w) of the present language postulates a Middle English **sound. From this sound it developed through un-rounding and lowering. There is some authority for a **n-form to among. Compare **lung* and **sung* n., West Midland forms for long, song. among, like these, had had its yowle groun-lensthened into a.

Before ng (and mb) this lengthening was taken off, and the o followed the development of M.E. o. This was an open sound: the A.S. o had been close.

quoth—The a of avo3 was labialised by the w into a. The unemphatic form would end in a sonant th. This was naturally stopped into d. qwoth is a compromise between qwath and qwot. There are other two pronunciations of this word, one like fwoth, the other like hoth. Of these the latter is stictly analogical.

-ward—This has weak ending with obscure vowel. ward n. has sound (50).

tippet.—The i of the M.E. form is anomalous. M.E. ., vetic with its shortening termination would resist lengthening and should have given mid-front-wide, a sound which it has in Scotch.

themset is due to the analogy of hemset (A.S. heman), 1 manig, by analogy of hemig, became mælnig. This, under the action of the back-shortening terminations, gave mani meni in Middle English. The modern many has the spelling of one form and the pronuclation of another. saide from sagget (late West Saxon nêde) is regular. A.S. de regularly gave pi, and in the Ancren Rivle the form neide occurs. But as Orm, who usually has a for a, writes negade, the e is probably got from the other forms of segum. ai was also a common representation of agin certain dialect-areas, and

saide was the form handed on for development. When the M.E. 'ai' had in the course of its development reached the stage of long mid-front-wide, shortening supervened, whence the modern (e). Many words suffered similar shortenings, as will be seen in due course, e.g., head, bread, threat, &c.

(a) is the regular development. sang—Nasal preterites in ng usually develop their a-, other words their o- forms, e.g., song n.

halter—Early in the modern period a parasitic u was developed before l, and henceforward the au- development was followed. This has resulted in (20), but in certain words shortening and widening took place, giving as result (3). Compare halt and salt, wallow, wander, was. The w rounded the a into (3). Lengthened ā resists any such action of the w, and develops regularly—wave (6i) M.E. wanten. song, long develop under o.

got—gat is the regular development. The past participle geten took o, on the analogy of broken, and this o spread to the preterite.

fern, earn.—The modern (99), associated with shortness, argues a reduction of the group-lengthening of these forms.

might—There was also a form mihte in late West Saxon. From this form, might (at) is a regular development. The h passed into a breath-glide, and was merged into the preceding i, which thus took on length, and followed the development of long i.

(ei) is the sound into which lengthened a before consonant + vowel has ultimately passed. scole—This form may come

from Norse skil. Long o was rounded to \bar{r} in Middle English. Sater, with (ell), is a fresh creation with the vowel of late. M.E. Sater is legitimately represented by Satter, for the M.E. form Sortified with the back-shortening termination would resist lengthening. Sares got its long vowel from the analogy of the long vowel of the preterite pluscives (M.E. Satera, levelled under vowel of singular, A.S. Schiffon), and of the past participle and infinitive, both of which acquired length in Middle English. Compare brake brake, and Sare Sare.

hade—The M.E. forms are had sing, hedre plu. Our hade with (a) is regular, with (4), it is an example of the levelling of the vowel of the singular under the vowel-length of the plural. The M.E. plu. haden would of itself, quite apart from the original wovel-length, take on the length that a vowel acquired in Middle English when followed by a consonant + vowel. M.E. å gives (4). There is the same alternation in ant, sate. Compare geore, broke, have.

woather word like other words with x followed by a consonant would acquire the sound of (mm)—see below under (ma)—early in the modern period and should in the : natural course of things have been now pronounced with (ma). Compare fast, from A.S. fasts. Perhaps it is permissible to suppose that, in this word, the (mm) sound was developed at a sufficiently early date to enable it to attach itself to the me's that come from M.E. \(\vec{a}\), in name. It may be that the analogy of words with long yowel before xt has given length. Compare for lengthening of short vowel before xt, yeast (see A.S. e). hall, slain, may are regular. at is a common representative of A.S. og in Middle English, and has through various stages passed in the present language into (el). M.E. ei at an early date was levelled under ai. steen should have given a vowelscand like that in deem, but has imported ai and its sound from the narticiale.

right—The Anglian is ahta. A glide-vowel has been developed before the h. Should have had same sound as fought.

old. lold—The Anglian \bar{a} was rounded to $\bar{\rho}$ in \bar{a} diddle English. This $\bar{\rho}$ has now passed into (on). But spellings such as oxold, &c., prove that l had here, as usual, developed the parasite u. It makes no difference. $\bar{\rho}u$ and $\bar{\rho}$ ran together in development.

comb.—The o-form has given development, and seems to have retained its group-lengthened long vowel.

bruk-"The M.E. bruk, breken (A.S. bruz, brucom), jt. sing. and plu, were the regular forms. In the North, the plural took on the vowel of the singular, while the singular vowel took on the length of the plural vowel, and conformed to the long vowel of the past participle and infinitive, The infinitive and past participle had acquired lengthening in Middle English by the operation of the principle that lengthens a vowel before a consonant + vowel. bruke got its o from the past participle bright (A.S. bruca). Compare spake (A.S. sp(r)ac sp(r)dvon). spake comes from a spikken, by analogy of brighen. The A.S. part. is spream.

numb—The group-lengthened $\bar{\varrho}$ was labialised by the $v\bar{\nu}$ into $\bar{\varrho}$ and has followed the development of $\bar{\varrho}$ into (uu). gere, berd—Long e before r regularly gives (is). hare, &c.—Long e before r gives (is).

dar—The \bar{a} is due to the analogy of the late M.E. preterite $b\bar{a}r$ (see below).

hervest, merke—r changes ϵ into a, a change which had

taken place in Middle English. This action of r had a wider scope in Modern English, and was general before final r. and r + cons. The a's (a) thus got were subjected to the change that was then overtaking that letter, viz., lengthening to (see). This has passed to (aa) in the present language. The lengthening just mentioned took place before r, and s followed by consonants, and before th, Note also the lengthening in chaff, shaft, craft (A.S. caf, scaft, craft). Thus is explained the modern pronunciation of harvest, mark, path, castle (and glass). It may be mentioned that hærfest is one of the words where æ represents umlaut-e (e). are presents the conditions for lengthening, and the vulgar pronunciation (ae) is really the regular one. The present pronunciation points to an unstressed arc. rater-In this word the back-shortening ending was sometimes operative, sometimes not. The first result gives (aa), the second (ei). Compare later and latter (see above), half, laughter-A u (not always written) has been developed before I and guttural h. This parasite was lost and the a, went to (aa) through (a, aa). Previously the / in half had dropped out between its parasite and the succeeding consonant. For additional examples take halve, calm, alms. answer (Wickliffe has aunswere) - In this word, after

ansner (Wickliffe has aunsterr)—In this word, after the analogy of Anglo-French, which wrote a lengthened nasal vowel before n, with an, a u was developed. This an has passed to (aa), without any intermediary. Of course French words in au take this development, e.g., aunt (and after its analogy ant). It is to be noticed that M.E. lengthened a does not pass to (aa) but to (ei).

warm-ar after w was rounded to (20)-compare dwarf (see A.S. e (eo)). water has undergone the same development -compare wallow and was (see A.S. a). The M.E. a, and the combination vowel + back consonant, are not subject to this rounding after w-wax, &c. all, balk-The a + parasitic u follows the development of au. This became a monophthong with sound (v), which was broadened later on into walk (A.S. wealcan) has had the same development. Some of the other words in this list have either au in Middle English, or have developed a parasitic u before guttural h. slaughter-compare with laughter (see above). draw-g passes to w after guttural vowels (a, o, u), cp. bow (A.S. boga). drag is a Northern doublet. hawk-The o of the A.S. form was levelled under e in Middle English, and intervocalic f (a voiced letter) was written v. The v then passed to w, after that, followed compression. fought-There was a form with au, early in the Modern Period. Compare the spellings nought and naught, and daughter, with ou in Middle, and au in Modern English (see A.S. o). The o in fought doubtless comes from the part. fohten. bore-The M.E. bar, beren (A.S. bær, bæron), pt. sing. and plu., were levelled to bar(e), barén in the North. From this came our bare, the short vowel of the preterite sing. being levelled under the long vowel of the preterite plu., the past part., and the infinitive. The o of bore has been got from the past part. boren (A.S. horen). Compare broke and brake.

It would perhaps be well to notice the difference between behave (ei), and have (æ) (A.S. habban, be-habban, M.E.

behauen, hauen). behave underwent lengthening, have was unemphatic, and retained short a.

haven and lathe are said to derive from Norse hafn and leb. They are probably new singulars, made for the plural forms that came from the plurals hafnir and labar. But there is also found an A.S. hafen.

e(eo): There are two $\dot{e}s$ in Anglo-Saxon, original Teut. \dot{e} (I.E. \dot{e}) (Goth. \dot{e} , \dot{a} (before r and \dot{a}), usually said to be close, and uniant \dot{e} (\dot{e}), resulting from Furnhaut of a, a, and e (rounded a before nasals). Examples of both $\dot{e}s$ have been given in previous chapters.

e sometimes represents a reduction of the ea that results from breaking of ea followed by I+cons, and r+cons., or at times, the (e)a that followed the palatals e, g, se.

In Anglian, ea before rc, rg, is smoothed to e.

In Kentish, e may represent y, the i-umlaut of w.

In the same dialect and in Mercian, e can take the place

of W.S. a.

e is also a common levelling for various vowels in

 e is also a common levelling for various vowels in unstressed syllables.

 c_0 is the breaking of c before k+cons. (x=kt), and final k, before certain k-groups, and before r+cons. The breaking of t in similar circumstances is also represented by c_0 (t0).

ov (Teut. e and i) has sometimes been got from the influence of the back wowel u in the succeeding syllable meads 'mead' (O.H.G. meta), scoffer 'silver' (O.H.G. stlabar). A succeeding v or a has in certain words the same effect. In Mercian examples of this are to be met with—berran and cotan, W.S. bernar and etan.

There is also an eo that is got from Teut. o or u pre-

ceded by the palatal combination sc-sc(e)op 'poet' (O.H.G. $scop\ddot{c}$ ', sde)ort (O.H.G. $scop\ddot{c}$ '). Compare the ea of similar origin from Teut. a.

Teut. j + o(u) is sometimes expressed by g(e)o - g(e)oe 'yoke' (L. jugum).

In Anglian, eo before re, rg, rh, is smoothed to e.

A.S. e was the mid-front-narrow, ee the same + mid-back-narrow-round, while e was the mid-front-wide.

In Middle English, A.S. e and e were both levelled under e (m.f.w.) A.S. ev was smoothed into open e. This as a rule remains unchanged, but the influence of the surrounding sounds, and the operation of certain principles give many results in the present language. Lengthened e or e before consonant + vowel, or before certain consonant-groups gives (ii).

suster.—The u was ii, or u, as a spelling with o shews.
sister.—This spelling shows the unrounding of A.S. y into
it. siex, six.—These forms are due to palatal umlaut of eo.
mingle, rid.—The raising to i is seen in many words link,
English, singe, string, kill (A.S. hlence, englise, sengan, streng;

ferien, &c .- This is the regular change into (e).

walsh.—The a for e is perhaps got from Wealh, 'a Welshman,' which would give a in Middle English. This word however had long ea when h was dropped in declension before a vowel. walist, where a has its occasional function of representing umlaute, might so far as the spelling is concerned, have given a in Middle English. The proper name Walsh preserves the a.

yelwe-w occurred in geolu in the oblique cases before a

and (ra).

vowel. eff—There also occurs a M.E. form affe. From the long open a, produced by influence of Norse ālfr, has been developed eaf (on). Ether has the hack-shortening termination which often prevents lengthening before consonant + vowel, but the ea of Leather points to long open e. This would be shortened in modern times as in the case of kealth, hours, &c.

hardness. **grstudati—The r has backed into the previous syllable. **grstra accounts for the i of the other M.E. form. **tarin—In late Middle English, r had broadened c to a in certain words. The influence of r in Modern English increased. Words with cr followed by a vowel, as was the case with the M.E. forms of harry and harry, were spared, but outside of these, the change was very general, save in her, which, being weak, has passed into (ash, through (x)).

This broadening often took place before two consonants. The a was in this position subject to the lengthening that ultimately gave (aa) (see above under harvest, and below under harv).

thrash—The change of e into a (m) is due to the influence of the r. For the metathesis compare ferse and fresh. The r originally preceded e. mache gives match, and is used got from generon, where the e. though representing

itself got from generoa, where the a, though representing unabure, has followed the usual course of a. cama, am—
The form com (for im, cp. Goth im) is due to the influence of the form corm, where the co is due to n-unibul. c, when unemphatic, tended through unrounding of second element to ca. The cam thus got, under the influence of wasing stress, shifted its strength to the second. The first element then slouthed off, leaving a.

Many of the words with (so), where the conditions were present (r or I followed by voiced consonants), suffered group-lengthening in Middle English. The presence of se is a proof of the long open e-sound. These dropped length in the Modern Period, (or (so) is got from short wowels (fr, er, rr.). burn—The ur may be got either from the us-forms of the Anglo-Saxon, viz., the pret. plu., or the past participle, or from the labilitiesing influence of \$\delta\$ on \text{co}, \text{or}, \text{in my be,} from late \(\frac{\delta r \text{in my length}}{\text{in my length}} \). Originally r came after \$\delta\$ in this werb. In second and secors the se would produce a un-sound.

resht, frohtan—Palatal umlaut gives the $i\epsilon$ i, whence the M.E. forms. The (k1) was got in the usual way. The k was merged into a glide, which, joined with the preceding vorel, gave long i. whence (a1). brikt—Palatal k changed the ϵ of krelt into i. Note the metathesis, the converse of what usually takes place. The original position of the r is beside the k.

tire—This word would follow the analogy of the many longs in irre, e.g., hire, &c. Contrast stir (A.S. styrian).

swalten—The a for c comes from the noun, A.S. swalten, M.E. swalter 'track.' weg &c.—A.S. eg and eg regularly, by vocalisation of g, give ai in Middle English. The spelings ai and ai (A.S. ag) were however confused in late Middle English and Modern English. Hence the ai and ay of the modern words.

 h_{CGM} —The g_{S} -forms of this word would give ϵi . thane—This spelling occurs in the Alliterative Poems. The $\hat{\epsilon}$ in suthtine before cons. + vowel, and M.E. ϵi , give slike in Modern English the result (el). break—The long close ϵ ,

into which lengthened c had passed, was retained by r. A pronunciation with (ii) is on record. Compare great (see A.S. e.). For yolk from g(c)olo, compare yolk from g(c)oc (M.E. yol(c)), the one due to parsitic on, the other to lengthening of o into long open o before consonant + vowel Both these effects give (on). yelke represents the common smoothing of the os.

stelen, &c.-Many of these words acquired their present sound from lengthening. wast must have got associated with some words that exhibit length before st. e.g. least. cust. Compare least and feast with an original short c. A short sound for reast is also on record, scoth and feels would in the oblique cases, on the dropping of h before a vowel, have as great-The long open c that came from ci. at the beginning of the Modern Period, seems to have got mixed with the long open e that came from M.F. c. and to have followed its development. Or there may have been a form artic, a variant of A.S. artic 'weak.' a gives (ii) in Modern English. steak-In late West Saxon there was a form specan. shield, wield-The long vowel is due to grouplengthening. it was sometimes employed in Middle English to represent the long close c. cren-The back-shortening termination was here inoperative.

thereow, &c.—The e probably became long in Middle English (before cons. + vowel). en gave (yrun), through various intermediates, with shifting of stress on to second element, and consonantisation of first element. The y was dropped after certain letters r, I (not always), &c. Cockneys and Yankees drop it more widely. east—For vocalisation of I compare M.E. hank (A.S. hasfer). mew—The n is due to combinations with the indefinite article an. Perhaps the nsound was repeated initially before the succeeding vowel, securing attachment in certain cases. Compare nuncle, nuc, vt. With regard to M.E. strauen, it may come from an A.S. variant with as for unlaute—cp. match.

**Pers. nure—Fr (vowel learthened before consonant +

vowel) gives (ia) and also (ia). mare—The a is got from A.S. meark 'horse.' hit exhibits confusion between ei and al. their derives from Norse peira, gen plu. of pers. pron. (but originally demonstrative). The forms of the demonstrative plural, had, owing to confusion between the singular and plural forms of the personal pronoun, begun to come into use. The usage received impetus, and the demonstrative forms colouring, from the Norse. [si, plm, [sira were coloured by pler (r-p-lue suffix), [sira, plara, the standard dialect admitted [si, but still used the personal forms here, hire, hire, for gentive, and hem, for dat and ace. them has the vowel of hem, and the consonant of the demonstrative. [si was of course the A.S. plural of the demonstrative (M.E. [si]). etr (alr) gives (sig) in the present language.

hard—The e of the ALE, form was broadened to a by the r, then suffered the lengthening that a underwent before r followed by a consonant. The was thus got, has passed regularly to (as). So with mar and harn. harn did not undergo group-lengthening. The spelling of hearth heres that it was subjected to lengthening. This lengthening was reduced or perhaps not constant. Then followed the same changes as in hart. The words that exhibit this reduced group-lengthening before r such as earl, earn, &c., have usually (we) in the present language. These doubtless kept the lengthening longer. In heart the reason of the ear

is not quite obvious. The word does not present the conditions for group-lengthening. Sweet says that the a 'may be a mere orthographic compromise between hert and hart.' hankes—The a may have come from an A.S. variant in a, or may have been imported from the noun hieahtor. The developed to has had no influence on the result. Compare hankfur (see A.S. a).

amenter (see A.S. a).

Amenter (see A.S. a), through lengthened a) by the w into (aa). werel, meral—Both were group-lengthened. Tyndale writes sweard (long open c), a pronunciation, which, perhaps shortened to the sound of herel, and with the r tilled, is not yet gone. In the second form, the group-lengthened o (a), that came down from Anglian, should remain close o, and follow its development. And this is so. Long w (the usual development of M.E. b) is given as its pronunciation in the phonetic authorities of the Modern Period. It also suffered shortening, and passed quite regularly to (v). Long w before r, carried to its usual development, should have given the sound heard in moor (us), but seems, as in the case of foor (A.S. fiv), to have been broadened to (co). Compare hours!

yaum—A.S. gāniam would give ā in Middle English. This seems to have been kept and narrowed as in the case of broad (see A.S. 4). With regard to the spelling it is to be noticed that are has the phonetic value (so), and that a form with a existed in Middle English. you're represents a smoothing of A.S. co.

A.S. i corresponds to Teut. i (Goth. ai before r and i).
 This represents I.E. i, and before nasal followed by consonant, &c., I.E. c.

Teut. i in certain words may represent I.E. č—wind (L. ventus, I.E. yčnto-).

Before nasals, A.S. i may correspond to Teut. e (I.E. e)—niman (O.H.G. neman). But these facts have been put down in a previous chapter (page 27).

There is also an unhaut-i in Anglo-Saxon. It has various functions, representing (1) y, i-umlaut of u, before e, g, h (2) ie, palatal umlaut of eo (breaking of c), before ht—riht (reoht, rieht), or ie, i-umlaut of the eo that may come from original j + u—gingra (giengra), comp. of geong (3) ie, palatal umlaut of ea (breaking of a) before ht—niht (neaht), or ie, i-umlaut of ea (breaking of a)—ido (iethu, O.H.G. alli, elth), or ie, i-umlaut of (a) (palatal umlaut of a—scieppan (Goth shapiran), weak vb., from seapan (c)a).

In unstressed syllables i may represent older i.

A.S. i was the high-front-narrow.

A.S. *i* remains in Middle English. M.E. *i* also represents the unrounded A.S. *y*. It (like *u*) is not subject to the lengthening which M.E. vowels take on before cons. + vowel, but it suffers group-lengthening.

Modern i has become wide. There were two i's at the beginning of the Modern Period, a narrow i and a wide i.

A.S. i. 8 micel, mycel muche, moche much rush rusche, rische risc (rysc) cwidu cude cud i bill 'ensis' bil bitt fiddle filicle fivele, fidylle seol(o)c (silcen adj.) selke, silke silk sife sine sieve yis e gise yes

00 hire, hyre hire, hure, here chirche, churche, cirice, cyrc church cherche hiree birche birch drittie britty, bretty, berty thirty bridd brid, byrde bird ai cild child child behindan behinde behind ic, ich, ih, ig, i, y pliht pliht plight nigon nisen, nin nine stigu stic. stvc. sti str 61 (ge) wihte wycht, weight weight winel, wenel ii wifel weevil wicu, wucu wike, wake, weke week hise, bese these

muche-This form is due to an A.S. mycel, got by the analogy of Irtel. The ii was made into u by the initial labial. The o of moche denotes the u-sound (see under u) The forms muchel and mockel also occur in Middle English -cp. Scotch muckle. M.E. u has passed to (2) through unrounding and lowering. rusche comes from a variant rusc. cude-The wi of A.S. cwidu would naturally give a u-cp. the A.S. variants widu and wudu 'wood' (see under u). quid is the regular development. fiddle-5 is often replaced by d in Modern English, chiefly in the neighbourhood of r and 1-cp. murder and rudder (A.S. mordor, rodor). We have the usual doubling of consonants to indicate shortness of vowel. scole (co. u-umlaut of i) would give M.E. selke. Development has followed the i-sound. The i in sileen is a reproduction of the original vowel by i-umlaut of co (through ie). sieve-The ie is perhaps due to a wish to avoid the characterless spelling of sine.

yes—The e is due to a dislike to the conjunction of the cognatic consonantial and vocalic sounds of p and i in pis, the Middle English and Early Modern form. Compare pet (M.E.: if, A.S. git).

here—The lowering of i to c is due to lack of stress. or (ir) in the present language gives (so). hure derives from hyre. churche comes from oyre. From this comes the modern word. ur also gives (so). cherche is Kentish, a dialect in which e appears for A.S. y. 'prety—Some of the related numerals have so. This would give c. third, thirteen, and thirry have suffered the same transposition—cp. bird. byrde—y was written for i in late Middle English. birdle belief use their sound from a group-lenthened i.

Long / gives (at). — e in Anglo-Saxon was often fronted after front vowel. This helped by waning stress would give M.D. ich. Northumbrian. in unstressed positions has ih, compare sagging 'said L' Consonants were dropped in unaccented monosyllables. Hence the weak I and the modern sound. Mith—h was weakened into a glide which coatlessed with iand produced I. A similar explanation holds for stye and wine. Some authorities give A.S. stigu. M.L. nin was inflected when used without a noun, and written nine with olural ending.

weight—The ei has come from wegan 'to weigh,' where it was not from vocalisation of g after palatal e.

never—The e is said to be due to the analogy of neglan.

necke—Ethmiller quotes an A.S. neace (see A.S. u), which
would yield swoke. e can take on the lengthening that is got
in the sequence of cons. + vowel. Long e gives (ii) in the
present language. Der gives these. It is a weak form of
pie. The e is the plural ending. A new plural was formed

by adding c to pis, nom. sing. n. after the old plural pis (A.S. pis) had gone out of use.

In speaking above of *muck* it would have been well to

have compared such. The A.S. form is snyth (suite, swelt).

M.E. forms are swite, switch, swelt, swelt. For the passage between wit and u compare A.S. cwitch, M.L. dout. The ch of the M.E. forms is noticeable. The c of Anglo-Saxon was possibly fronted before the c of the oblique cases, or the ch may be due to want of stress. At any rate a similar ch appears in certain pronominal words—kwitch, ech (A.S. kwilt, at/s). The valgar pronunciation of such still preserves the memory of the M.E. forms that had completely

unrounded the A.S. y.

o: A.S. o (close) corresponds to Teut. u (o) (O.H.G. o

and u, Goth. u, ai (before r and it), I.E. u).

The prefix represented by Goth. ur, O.H.G. ur, appears in Anglo-Saxon as or—orsory 'careless' (O.H.G.

Dialectically (Northumbrian), after 10, 0 stands for 00, the breaking of 6—2007s (19007s), and for 00, the 10-timbut of 6—

worold (weoruld).

Final σ may represent the u (vocalised w) of the nomina-

tive of ave stems—scare (also n) 'armour' gen. narrace, also another n' (Teut. i), in words like ildo (n) 'age' (icida, O.H.G.; alli, citi). The breaking as in unstressed syllables may be represented by o—hisjord (hisj, weard). Long a (Teut. at), may be similarly represented—čorod 'troop' (coh 'horse,' rid' 'tiding').

Teut. -un] may pass through -ūv into -ov (also nv)—geoguv 'youth' (O.H.G. jugund). So may Teut. -an] through -pnv, -ov.

And n may be developed before a final liquid—fugol 'fowl' (Goth, fugls), hlütor 'pure' (Goth, hlütrs),

The or and of that represent 1.E. r and f have already been alluded to (pages 64 and 66).

The o (open) from orig. a has been spoken of under a.

A.S. o was the mid-back-narrow-round.

The sound was widened in Middle English. It remained for some time in Modern English, but was at length lowered to present sound. It was also changed at a later date into (so) before certain consonants, viz., s, 'th, in fact, before the same following that lengthened a (page 214).

Lengthened before a consonant + vowel it gives (ou) nose (A.S. nosu), like the long open o (\$\bar{c}\$) that came from A.S. \$\bar{a}\$, e.g., home (A.S., ham).

The lengthenings of Anglian o before certain consonangroups (rd, ld, &c.) are maintained with restrictions (page 200). They are naturally handed down into Middle English with close \(\tilde{e}\), and keep by it, but at the sur-stage (see under 0), the sound is broadened into (20). Compare A.S. flor into floor (20). Compare also sureral (page 224) and sword (see next list). Some words, however, like board and hoard (A.S. bord and hoard), seem, judging from the on, to have acquired a long open sound, sudd came down into Middle English with group-lengthened close \(\tilde{e}\). This regularly gives long u, a pronunciation in vogue last century. A parssitie u added to o accounts for the modern pronunciation.

For ou from of see under &.

shore, &c. — The sound (v) argues a previous short u.

The sound these words may have acquired by association with the e, that was a graphic device for u before consonantal v.

The verb shove (A.S. solfan with shortening of u in M.E.) has (v), and may have influenced shove. All these words had back-shortening syllables and resisted lengthening.

Compare for the development among.

copper, than.—The vowel of unstrest syllables and unstrest words naturally pecomes the obscure (e).

welkin—Owing to association (wee's sometimes become we's, cp. woruld, for weoruld) the spellings weo and we get mixed. M.E. welkine acquired its e from the smoothing of a form beginning with two. then derives from the late W.S. Scane.

schold, nodd — These occur with abort vowel in the Ormulum, in spite of the group-lengthener ld. Diminished stress will explain this. Afterwards both acquired a n-form, scholds from the plural schulen (A.S. scalon), or from the infinitive, and wolds from the rounding effect of the wo no. This n was longthened before ld. Lack of stress induced shortening. In weak positions I was dropped, and the I-less forms have prevailed.

morwen, &c., develop o in the usual way. holi, bodi.—The back-shortening terminations prevented lengthening.

word—The (ee) argues a shortening of the long u that came from M.E. \bar{o} (from group-lengthened Anglian o).

So with world. ur gives (ee)-wereld represents the

usual smoothing. murder — The u comes from the verb myroran.

hole—Lengthened a became (on). So did parasitic on, as in folk and hord. A parasitic u was developed between and l, just as between a and l, and not always written. yoke, choke.—In goes and continn, the c is used discritically to indicate palatisation of the preceding consonant. The developing rowel will then be a. But we have also on record cheken, got from usual smoothing of the ov. Compare chee, from closure.

over—This word underwent lengthening. The backshortening ending was inoperative. molde was group-lengthened, but the present sound is due to development of parasitie v. Mogen—og into ou, with usual result.

score, before, sworen-The o was lengthened before cons. + vowel. Long open o + r gives (so) or (so). forth, frost, broth-These have lengthened o into (22), Contrast fost 'stake,' with (ou). It has taken after the Romance post. bord, group-lengthened, with usual change of long open o into (30) before r. See page 229. trog-Open g, when final, was unvoiced in late West-Saxon. The w that was developed before the gh in cough, trough, bought, had no influence on the development. The o followed pretty much the usual course to (so). Compare for neglect of w and lengthening-laughter (see page 214). daughter had the same development, but is spelt with au on the model of words like slaughter (see page 215). Compare the two spellings naught and nought. These different spellings of the same word have been utilised. fought also once had a variant faught (see page 215). an and o(n) have the same development before A.

Another example of o into (v) is A.S. doi, M.E. dui, Mod. E. duil. Perhaps the influence of Norse dui 'conceit' may have brought in w. Another cample is given by Screet, viz., tog, from A.S. togian. With regard to own and skor i, is it not possible that the ow of the spelling would suggest the pronunciation of long u. This may afterward inverseen the passage to (v). In the case of know, the pronunciation seems to have fluctuated between (vs and (o). The former is still often heard.

u: A.S. u corresponds to Teut. u—suņu ((ioth, sunus).

After w, u represents (1) co, the breaking of e—swurd
(sweard) (2) co (io), the breaking of i—wuht (wiht) 'thing'

(3) so (iv) the u-umlaut of i—wudu (wiodu, widu) 'wood'
(4) an co, due to the action of w on e—wuntor (sweather).

O.H.G. swester). u also occurs for wn = wi (Teut. we) in
cunau = actiman (O.H.G. overnan)—co. whi for wuht.

Some of the uses of u in unstressed syllables are worth recording. It may stand for δu —fultum 'help' (fultiam). In Northumbrian u (w) stands for $\delta o(w)$ — $l\ddot{a}ruw$ 'teacher'

(/ārēnw—/ār 'learning,' %ēow 'servant').

Final u may represent (1) I.E. & (Teut. & O.H.G. u)—
gigu 'gifu'-compare the & of the &-declension (2) I.E. up
(Teut. um)—huitu acc. sing. 'nit' (Gk. zwide) (3) I.E. &
in the Mercian pres. tense of verbe—hours (I. ferö), W.S.
here. And u may be developed before a final nasal—
maßum 'treasure' (Goth. mai/bus' gift').

The un and um, ur and ul that represent I.E. u, m, r, l, have been spoken of in a previous chapter—genumen (O.H.G. ginoman), wulf (O.H.G. wolf).

A.S. u was the high-back-narrow-round.

In Middle English the A.S. a retained its sound, but in

the Modern Period was unrounded, and then Jowered to (v). In many words where the sound under change was flanked by a lip-consonant and I, a letter with a strong affinity for u, the u-sound was brought back, e.g., in full, full, &c. An initial u also tended to conserve the u-sound. In some words the, passage to (v) liad been accomplished, and this sound may still be heard in certain pronunciations of buther, twoman, &c.

In Middle English, n was often written as a, especially beside consonants with outlines resembling those of u, vi_{-} , u, u, u (consonantall), and before a cons. + vowel, seeing that this is a position often occupied by Fr. u, and suggestive of it. In Middle English, u, like i, was not subject to lengthening before a cons. + vowel, but was liable to group-lengthening.

		A.S. u.	
18	urnen, pret. part	urnen	TUR

uu	wur-l	wounde	wound
	Surh	thrugh	through
aa	for	ferther	farther
ออ	đura	dure, dore	door
	mrman	murnen, mornen,	mourn

run-The infinitive may get its vowel from the participle urner. Or the u may have been got from the late W.S. yrnan through tirnen. The regular infinitive would be, and is dialectically, rin (A.S. trnan). For the transposition in the various forms of this vest compare burn (A.S. trnan, Teut. brinnan) (see also page 221). Juruh gives regularly thorough—cp. borough, A.S. burh, M.E. burch. For the oforms see above.

bulleck (second syllable), upon—In unstrest syllables and unstressed words (e) is a natural enough termination for (v).

wood, bullock (first syllable), &c.—These are examples of the retention of the u-sound, referred to above. The spelling oo has probably been adopted as more suggestive than the single o, which is usually associated with the sound of o in god. wif—w contraction for wu.

further-ur gives (99)-compare below, farther.

drounen—The long u, evidenced by ou, is due to compensation for loss of k, and has followed the development of long u. hound—group-lengthened to ü. sugu—After u, g became w and then coalesced with u, giving ü, whence (au).

coulter-A u has been developed before the 4 and the

Manual of Linguistics.

	ryge	rie	rye
au	dyhtig	duhti, dohte, douti	doughty
ii	yfel	yuele, uuele, cuele	evil
	wyrd	wirde, werd, wierde, weird	weird
00	hyrnetu		hornet

]prushe—M.E. u developed in Modern English through unrounding and lowering into (2). shelten is Kentish. verweren.—The o shews that the u=0 lad, owing to influence of lip-consonant v_0 been completely backed to u, for which o is a common variant in the neighbourhood of a, m, and u. busy—The pronunciation of the modern spelling proves that the M.E. $u=\bar{v}$ had not become u, but had remained and been unrounded to i later on, unless the present pronunciation has been transmitted from bisi. guill—The gv indicates hardness. As for winners, no M.E. form in i is quoted. merie—The e-forms have given development. bury has the spelling of one dialect and the pronunciation of another. builden—The u ringues long \bar{u} in Middle

English. To account for the modern pronunciation (got from later unrounding of #, or transmitted from form bild n), there must also have been a form with short vowei everythonally retained before Id. For similar retention, compare gild (A.S. gyldan).

worst, worm—These M.E. forms shew that the # had been completely backed to u. ur gives (ee) in the present language. So do ir and er.

friht—The k changed into a glide, which with preceding i gave i, whence the modern (al). kinds—The i was group-leave the oto i. For rie compare stie (page 226).

doubtly got long u from effect of parasitic vowel de-

veloped before h. The spelling has been influenced by M.E. $dm \cdot n$ and dought (A.S. dugan, dohte). The long u it developed to (au).

cutle—Kentish e, with usual lengthening before cons. +
vowel, will give in the present language (ii). werd grouplengthened gives long e. This close ë was sometimes denoted by ie, which in Anglo-French had been smoothed into
ē. And ei in some words of French extraction must have
had this sound, judging from their development, e.g., deenit,
seison (sesson). So that where and weird denote the same

sound as werd.

hornet—No M.E. form is quoted. Sweet says the analogy
of horn gives hornet.

CHAPTER IX.

SOUND RELATIONS IN ENGLISH—LONG VOWELS AND
CONSONANTS.

ā: A.S. ā corresponds to Teul. ai (I.E. ai, aj) (Goth. di, O.H.G. ci, δ). In Anglo-Exon there was dwarfing of the second element followed by compression. A.S. ā also corresponds to Teul. ā: (I.E. c̄) before ar, or when the next syllable has a, a, κ—κ̄ῑανων 'saw' (Goth. κ̄ῑρνων), stāṣκων (Goth. κ̄ῑρνων). It represents the results of various lengthenines.

A.S. a was the long of a.

In Middle English A.S. \(\tilde{a} \) was rounded to \(\tilde{e} \) (long open \(a \)). It remained in the Northern dialects. French \(\tilde{a} \) was imported after the rounding was over, and remained. A new \(\tilde{a} \) was got in Middle English from the lengthening of \(a \) before a consonant+vowel. This has passed to \((\tilde{a} \)). Northern \(\tilde{a} \) and French \(\tilde{a} \) have the same development.

M.E. ϕ was first narrowed in Modern English. It then passed to the diphthong (on), which has the first element open. The surroundings of the sound have however contributed to various results, as will be seen from the following table.

For ω, see under 6. A.S. δτο becomes ζω in Middle English. This has the same development in the present language, viz., (on), as an δτο coming from A.S. δτο. Parasitic ων (ω before /) has a similar development. The result (on) is thus set from δ. δτο. δτο. από ων.

242

one—The pronunciation with long open o was extant early in the Modern Period. Previously, in some parts, the extra effort required for initial vowel, seems to have developed the labial element into so. Then ensued labialisation of vowel and common passage to (9. An initial development of a palsal element into y may be seen in the Scotch ane and yen. The su-pronunciation of one was common in the Western dialects. Odinpare also would for old and wouts for out, pronunciations heard in Dorsetshire. none—analogy of one.

shad—The short wowel of the M.E. schedde pret, a new formation, was extended to the present. This extension of vowel (lette, new formation, and spreadly will also explain the shortness in let (page 246), and in spread (A.S. spreadan). hallow—The vowel was shortened in Middle English in the form where I was followed by w.

anon—Here we see shortening and lowering. shone has also (ou). sorry—The M.E. form with a was short. The long yowel had probably been shortened by the action of the

back-shortening termination. Chaucer, however, has a form with long a, viz., soory. Perhaps the present o and its pronunciation have been got from influence of M.E. sorres 'sorror' (A.S. sorg), holiday—For shortness compare holigholds. See 'sorror' (A.S. sorg), holiday—For shortness compare holigholds. As 'wa'rdgo—Many pronounce with (on), hot—For shortening of g compare shortening of f in head.

(tii)moves shews influence of the other mouse (A.S. mix). heit shews influence of Norse heit. The regular development of A.S. hait gives whole. reade—This is Northumbrian form with long a, whence (ei). read is the lineal descendant of A.S. raiz. race, from Northumbrian rase, with long a.

(on) direct result of A.S. ā. souv—A.S. āw gives āw in Middle English, which passes to (on) in Modern English. soun shews ordinary change of g to we after guttural wowel. dongh, a parasitic w makes no difference; ρ(w)h and βuh give the same result. Compare low (Norse lög), M.E. lah, louh, lâhloonh.

sweep—The vowel is from M.E. pret. swep (A.S. sweep). There was also a M.E. swep(i)en (A.S. sweepian). swapan gave swopen in Middle English.

who, two—The $\bar{\rho}$ from \bar{a} was in Middle English made into $\bar{\rho}$ by the w, and followed the development of that sound.

ask, &c.—The a was shortened before two consonants. It (a) was then lengthened before $s+\cos_s$, and $r+\cos_s$, and passed to (aa).

or, nor—The weak forms passed through ρ̄uδτ, ρ̄δ, ḡ, to a.
or gives (so). broad—The M.E. ρ̄ (low-back-wide-round) was
preserved in this word by the influence of r. It is now narrowed to (so). Something similar happened in the case of
grant (A.S. groθ), with lengthened o in Middle English. Compare braz h (nege ± 21) and grant (page ± 25). aught nought-

Manual of Linguistics.

244

The \bar{a} is regularly represented by the \bar{e} of oht and noht. alt and noht represent shortened \bar{a} before two consonants. a with parasitic ν before h gives au, which has passed to (no), first becoming a monophthong (the long low-back-wider-cound). A u-less pronunciation of $a(\nu)h$ would give pretty much the same result—cp. sought (page $z\delta b$). aught is the spelling now preferred for the sake of distinction from soght. sought, same explanation. The \bar{e} may come as before from a form that was subsequently shortened, or from the infinitive $\bar{g}ouen$ (A.S. $\bar{g}gan$). Then should have been those (heard in North Cumberland), like sow, but has developed like short sought.

ā: A.S. & corresponds to Teut. & (I.E. ε) (Goth. ε, O.H.G. ā). In Kentish and Anglian this is written. Æ. There is also an & which represents the ℓ-umlaut of α (Teut. α) in all the dialects. & is also its own (Teut. α) umlaut. This in dialects other than West Saxon is, like its original, written č. In Anglo-Saxon & also represents a lengthening of &(α). Dialectically, it represents α (Teut. αν) before ε, ε, ħ, and the ℓ-umlaut of Teut. α before ℓ+cons. (W.S. ε).

A.S. & was the long of & (low-front-wide).

M.E. $\bar{\epsilon}$ is the regular representative of A.S. $\bar{\alpha}$. It has now passed to (ii). At an early date narrowing supervened. See under $\bar{\epsilon}a$. For ϵa , see under $\bar{\epsilon}$.

sick (page 258) redels—For loss of s in the modern word, compare burial (A.S. byrgels).

less—& when shortened before two conss. (page 200) was in Middle English written e and a. Midland and Northern texts affect e. errand was shortened from a M.E. form in which wwas followed in pronunciation by n. ever was shortened later on in Middle English before two consonants. let, over, &c., were shortened early in Modern Period (cp. shee). The shortening in breath is comparatively recent. mendany

—The w is got from the oblique cases. mend has developed regularly (ii). Aread and read suffered shortening in Modern Period. read (pret. A.S. reddes) seems to have kept length in Middle English in spite of the two consonants. The present read (A.S. reddes) has kept on to (ii), ate has two promunications (ei) and (e). The first pronunciation is that which a short M.E. at would acquire when levelled under the quantity of the plural. And a short preterite singular was developed in Middle English (or in Anglo-Saxon), after the analogy of other verbs with short singular and long plural. The long vowel in A.S. & js exceptional, but Teutonic The pronunciation with (e) is a shortening from early Modern English of the then form of our regularly developed preterite eat (ii). The pronunciation with (e) attached itself to the spelling ate. Compare the pronunciation with (e)

jat, &c.—The a-forms have given development. M.E. a regularly becomes (a). Tadder, &c.—The two consonants were developed at a late period in Anglo-Saxon. After long vowels, t and d were then sometimes doubled. For loss of n in adder compare auer (A.S. naforār).

tion of preterite beat as bet.

were—It is a weak form with short e that has given the present (ee). The M.E. form had \bar{e} .

either, neither—The vulgar pronunciation with (et) is regular. The (ii) pronunciation is explicable. The long close e into which M.E. e ind developed may have gone over to the long close s's that came from M.E. e. Compare key in this ist. The (et) pronunciation is irregular. A.S. aghwaver is from a (E. aye), umhauted into a by the i of the orig, et that followed, er- (ordinary prefix), and hawaver (E. whether.)

lefdi is the Northern form of shortened &. lauedi and ladi are Southern forms. The a was lengthened before cons. + powel. clay-M.E. & (A.S. &s) is generally represented in Modern English by the spellings ei, ey. M.E. ei, A.S. eg, æg (Anglian eg) has the same representation. These two M.E. diphthongs suffered shortening and followed the course of ei. Both short e's were open in Middle English. M.E. ei (al passed to long open e through at) assimilated both elements to a long open e, and, after narrowing, passed to the diphthong (ei), which has now the first element open. There was a mixing of the spellings at and ei. neigh-A.S. eg has usually become (ai)-cp. tie. dye (page 252). wave-M.E. wave is due to influence of wawen (A.S. wagian 'move'); wave has been influenced by the verb wave (A.S. wafian). yea-The long close e that was regularly got from M.E. & was retained as in break and great (page 255). It has now become (ei) like the long close es that derived from M.E. a.

mass—The long σ is due to the $\bar{\sigma}$ of the comparative ($m\bar{\sigma}_{L}m\bar{\sigma}_{L}$). A.S. $\bar{\sigma}$ was rounded to $\bar{\tau}$ in Middle English. M.E. $\bar{\tau}$ gives (ou). stots—This form and pronunciation is due to the influence of $st\bar{\sigma}_{L}$ 'slow.' lons— $l\bar{\sigma}_{L}$ and not $l\bar{\sigma}_{L}$ is responsible for this form. mean—due to influence of the noun mons, mon (?) (A.S. $m\bar{\sigma}_{L}$ 'dickenses.')

(ii) is the regular development. each—For loss of compare which and much. The l is retained in the North, e.g., Lowland Scotch life, which must not be confounded with another ille meaning 'same' (A.S. ylan). tease—The form toose must be due to some form with A.S. ā. There is also a compound to-tusen 'to pull to pieces.' taisen—Perhaps the l is a parasite developed before a front consonant as in M.B.

aitche 'ashes' (A.S. asce). The plant has M.E. tesel, tasel. speech.—The r dropped at a very early date. key.—cp. cither (see above).

lett'd—\(\bar{c}u \) (\(\bar{c}u \)) passed to ((y)uu). mew—There are forms quoted with ea and e. In the North the word is pronounced (au). A M.E. move occurs.

r.ur-r. has become (is) or still broader (is). bitr-for is, e.p. page 188. cre—There are also M.E. forms ar, or, the first representing a shortened unstressed & the other shewing influence of Norse ār. hair—The ai is got from the analoxy of many words ending in r.

last, &c.—the a shortened before two consonants. It (a) was then lengthened before s+consonant and passed to (aa). ant by the analogy of ann! developed a u and with this passed to (aa) (page 214).

wash—a was shortened in Middle English, and by we rounded in Modern to (so), see page 215. Inwyht—a was shortened before two consonants in Middle English and st developed. au passed to (so). Compare fought.

6: A.S. ε corresponds to Tent. ε (O.H.G. κα, κα, κ). It also represents the ε-minlaut of ε (and lengthened »). It is the result of certain contractions. In dialect it stands for εε, the ε-umlaut of εα and εω. It also in dialect answers to the εκ that followed palatals, and is the smoothing of the εκ and the εν that preceded ε, ε, λ. It may also represent W.S. εν-πεά advice, W.S. πεά.

A.S. ē was the long of e.

M.E. \tilde{e} represents not merely A.S. \tilde{e} \tilde{e}_{θ} , but also Anglian \tilde{e} (W.S. \tilde{e} and ie(g)). In Modern English, after \tilde{r} had become diphthongised, \tilde{e} was raised into its place and made

its passage into the modern diphthongic (ii). ξ ultimately reached the same goal. Words that derive from long close e have e in modern spelling, words that derive from long open e have e e(e). There was confusion in spelling at an earlier date. Compare the use of e0 and e0.

Many of the forms in the A.S. column are Anglian.

		A.S. ē.

aa	hērenian	herknen	hearken hark

hung—The M.E. heng was shortened. For the rare short close e thus obtained i was substituted. The hing thus got was, on the analogy of sing sang, made into a present with a preterite hang. The analogy was extended by the creation of a participle hung, the vowel of which was assumed by the preterite. The modern infinitive hang was got in the Middle English period from A.S. hangian.

breeches, &c.—shortened from long i. Short i is a wide sound in the present language.

the ft, &c.—The vowel was shortened before two consonants. Short close e was opened in Middle English. It has remained.

bramble—In the New English Dictionary mention is made of brembil brambel, shortenings of bremb brambel before the two consonants (m + euphonic b). brambil would give bramble.

heard—To account for the once prevalent (and still existing) pronunciation (hard) we must assume shortening before the two consonants. The short e thus got would be changed to a before r in Modern English. But the spelling are shows that short herde must have been group-lengthened to hērde. The length would enable it to escape the passage into a that r marked out for a preceding short s. Later on the e was shortened, as in many words (page 255). er gives (es).

height-M.E. eiht usually gives (ei). Compare eight. This word has taken after its adjective high. tie, dye-The Anglian \bar{e} was assimilated to the glide i that was developed between it and g. From i comes (al). briar, hard to explain. Compare the change of M.E. frere into friar. In the sixteenth century brier was in vogue. For the spellings brier briar, cp. lier liar. brere occurs in Shelley's Adonais-'And build their mossy homes in field and brere.' hav-ei is a more frequent representative of M.E. či (či). eit-Sweet says through ego, zho. M.R. ei (ai passed into long . open e through ai) assimilated both elements into a long. open e, and, after narrowing, passed to the diphthong (et), which has now the first element open. The spellings ai and ei were confused. waste-The French word displaced our ; own. These French spellings in ast pass to (et), compare paste, taste.

më—pë are monosyllabic lengthenings in Anglo-Saxon (page 199). This list exhibits regular development. believe —ie represents close ë (page 188).

bruise—The late W.S. form was brjean. The modern word is an instance of the preservation of the spelling if (with the French character ui (page 190)). Compare the course of rude into (uu). bress may come from Anglian britan, or be a Kentish form with ē for A.S. J. brossen is supposed to derive in some way or other from O.F. bruisier brisier, which was merged into brysan. The form brissen with short vowel is anomalous.

here, &c.—ēr gives (ia). hark—The vowel shortened before two consonants was changed into a before r and developed through (a, asa) into (as). The spelling hearken indicates a lengthening (long open e) before r-combination. Of this there is a shortened pronunciation recorded, cp. heard (see above).

ēa: A.S. ēa corresponds to Teut. au (I.E. au, oμ) (O.H.G. ou, ē (hefore dentals)). It is the result of various contractions. There is also an ēa = (e)ē got (rs) from a sequence of the palatals g, c, sç and Teut. êa—g(e)āfon (O.H.G. gāðun), (and) from a sequence of the palatal g (Teut. f) and Teut. êa—g(e)ār (O.H.G. fār), (3d) from a sequence of the palatal s+ē (Teut. a)—se(e)āār (Goth. shādām).

A.S. $\tilde{\epsilon}a$ was the long of ϵa (low-front-wide + low-back-wide). M.E. $\tilde{\epsilon}$ regularly represents A.S. $\tilde{\epsilon}a$. It has commonly given (il) in the present language. The $\tilde{\epsilon}$ in Modern English was first narrowed, then raised to long $\tilde{\epsilon}$.

		A.S. ēa.

yuu	hëawan dëaw	hewen deu, dew	hew dew
ie	nëar tëar	nere, neer tere, teer	near tear
20	geard	stre. voore	vore

forehead, less—Shortening of long i in unstressed syllable gives short i (wide). A pronunciation with short e is common in both words. In the former, this will represent the short wowl in head, in the latter, perhaps the influence of the other less.

rick-For shortness compare breeches (page 251).

death, &c., ordinary shortening of M.E. ¿ as in breath, heavy (pages 220 and 246).

heifrs—The ei corresponds to the ei of heih (see below). In that word the is a glide-wowel developed before the h which afterwards raised the ē to its position. In heifrs the ei seems to have followed the development of M.E. ei, and when the long open e stage was reached to have been shortend as in heavy, death, head. The ei of haifrs will then be another spelling of ei (page 252), compare neighbour, (M.E. neihebur, A.S. neah-gebür). ei is always written before gh.

lather—Suppose a M.E. & Ever. This might be shortened by the action of the back-shortening termination er. Back shortenings occasionally produce as well as conserve shortness. Aspinan—There must in Middle English have been a shortening into ea, which would give f, whence a (page 206). http., ove—The Anglian hit and to ge became in Middle English hit and it by the action of the glide-vowel on the preceding ē. The open g disappeared in it. Our present spelling retains all the letters (e.g., eye) that once were pronounced. The long i thus got in these words gives (ast).

great—The r retained the long close e into which M.E. f had developed in the Modern Period. Long close e has , now become (el), of which the first element is open. Compare break [page 221].

chees—This is regular from ceas. chose is either the descendant of A.S. class (A.S. & gives M.E. & whence our (vnl), or the vowel has been got from the M.E. participle chaese. The A.S. participle was coren, but in Middle English it acquired ch and s from the other forms of the

verb. show—A.S. sel-jārwian would give sel-jārwien in Aliddle English. From this has come show. sel-jārwien would be the regular M.E. development of A.S. scārwien. From this we have the spelling shess, but the prounciation is that of show. jēzā is a hard word and seems to have developed its vowel like (*)ā, as in the previous words. The result of this before h should have been (theof), cp. North. thej. For z[u]n his Middle English giving (as) in Modern English, compare sught (M.E. z[u]n)tt. A.S. shot). The (on)sound of modern though indicates a weak form with loss of gh, cp. dough (A.S. shih) (nage 143). Short or in steaht and feaht (slaughter, fought) has also given this sound (20).

flea—(ii) is the usual goal of ēa in Modern English. belief—For the ie, see page 188.

shrew, hew, ded-For M.E. ču, see page 222.

New—The analogy of the know knew and grow grow class has produced this. From the M.E. forms there are theoritically three sound-forms deducible (ai), (ou), (au).

near—r gives (is).

yore comes from g(dörn. A.S. & becomes § in Middle English. &r gives (00). raw has developed as if from short earn. Compare than. So with straw, but the stree of Middle English points to long c. With stree compare the Scotch word.

80: A.S. & corresponds to Teut at (I.E. at) (Goth. iu, O.H.G. iu, eo, io, in). It is the result of various contractions and lengthenings. It appears after Teut. j and palatal se with value (e)ē—gēomār 'sadness' (O.H.G. jamar), szôb 'shoc'.

A.S. co was the long of co (mid-front-narrow+mid-backnarrow-round). A.S. ēo.

M.F. ē represents A.S. ēo. See under ē.

sick, shortened from long sound. Compare breaches. hip, similar shortening. hep (a) probably represents a shortening transmitted from that stage in the Modern Period when M.E. s (and s) was shortened. breast, long in Middle English. The se shows that the

breatt, long in Middle English. The en shows that the word had long open esound in Modern period. Compare heard, which was shortened and lengthened again in Middle English (page 252). Compare the course of breatt with that of priest. held had long close e in Middle English. There

is also a spelling with it. The shortening would take place early in the Modern Period, or a short form may have come down from Middle English. Friend—The it is one way of representing long close e (page 188). Very much the same may be said of this word as of held. Forst and friend are often to be heard with the (ii) of the regular development.

stern—er and ir give (ee). thirteen, transposition of letters as in third. The A.S. word has many forms, such as eco(t), it, it.

Hight—In $h(\phi)ht$, the e was changed to i before platal h. The vowel in this word before breaking was i. It was shortened before ht (ep. sih_t , page sih). In Modern English the h of liht passed into a breath-glide which, merged in the foregoing vowel, gave long i, whence the (a1). pch—The \bar{e} was raised to \bar{e} by the parasitic glide that was developed before the h. The stages were—iih, iih, iih.

trate—This could come from M.E. ü, which gives (au) in the present language. The ü seems to have been due to influence of Norse trūu 'trow.' The A.S. original is also sometimes written trūuian.

sea (sow obs.) The spelling derives from M. E. seems, the pronunciation, from source. The analogy of show show may have had something to do with the development of similar forms in this verb. M. E. source might have been got from the influence of an A.S. participle source, which we may suppose to have existed. The verb had a mixture of strong and weak forms in Anglo-Saxon. The pronunciation proper to the spelling zero may be heard any day in Soutch. Irotherm in the control of the spelling source in Anglo-Saxon. A pronunciation trought in Middle English would account for troth. It has also the pronunciation of broth. Compare four, where the e was

rounded out of existence by the neighbouring lip-letters. The r has of course shaped the $\bar{o}v$ into (50).

(il) is the regular development. For the sh in she see (page 290). merze (neeze obe), due to refashioning of the difficult initial sound of fneeze. gebton is theoretical. No participle appears in Anglo-Saxon. cleave—There was a weak A.S. verb cleofian 'adhere' which gave in Middle English cleoin. From this cleave 'split' got the long open as (page 250). beat—The en got from the present (M.E. byten, A.S. béaten), or shortened from a M.E. weak byten, priest, lief—For it, see page 188.

M.E. & is written av in some words and sometimes us,
u. It developed to (ymu) through various intermediates,
with shifting of stress on to second element and consonantisation of first element. The y was dropped after certain
letters—y, I (not always), &c. Compare what is said on Nu,
page 22s. if in French words) final as well as medial
was levelled under &u.

choose is a phonetic spelling of earlier cheese. This was the descendant of M.E. chiese. The fi is a dialectic development of A.S. fo, and has had the development of in. The M.E. chesen (regular from ciosan) was also represented by cheese early in the Modern Period. shoot—The same explanation accounts for this word. loss—a first floors, then lose, to differentiate it from loose adj. The for of forlien was dropped owing to influence of lossien (A.S. lostan, usually neut.). Sweet does not explain the vowel-bound of lors as he explains those of choose and shoot, but avers that the (of early Modern Period) borrowed the vowel (uu) of the adjective lows (M.E. lor, of Norse origin).

yule-A.S. g(e)ola would give 5ole in Middle English.

Long close o was passed to (un) in the present language. The influence of Norse jol would also tend to give this result. grown—The g passed to w and then dropped. youth has exceptionally retained its long u, cp. unowith.

dere—ēr gives (ie).

driling, farthing—There was shortening in Middle English. Then ensued in Modern Period change of e to a by action of r. The a (as) was lengthered before r + cons. (page 214) and passed through long ze to (aa). four—See above under trath.

i: A.S. i answers to Tent. i (Goth. i I.E. i). The sound is very constant. A.S. i may also answer to I.E. $e_i^i - p r i$ (Gk. $r p t \hat{e}_i$). It stands also for a compensatory lengthening of Teut. i. Sometimes an original \hat{e} finds representation in Anglo-Saxon under \hat{t} . The \hat{t} 's that are the \hat{t} -umlauts of \hat{a} and \hat{a} 0 are also thus represented. A.S. i was the long of \hat{t} .

In Middle English i remained. In Modern English it passed by divergence of first element into a diphthong, and through lowering, retraction, and widening, reached the sound (at).

A.S. I.

ii sni	can	sniken	sneak
yuu spi	wan	spewen, spue	spew, s
tiv	res-daeg	tisdei, tewesday	taesday
yuo sti	g-weard	stiward, steward, stuward	steward

cristendom-The vowel is shortened before two consonants (page 200). Length however often remains before st, e.g., priest, least (page 258). The quality of the i is altered in the shortening. Short i is wide. stirrup, shortened from steerup. dich-The c was softened after the front vowel, supported by the e of the inflectional forms (page 278). In dike the vowel is regular and there is no Southern softening. twit must once have had long i. Spenser rhymes it with light and plight, and writes it by false analogy twight. linen-The vowel is long in line. Perhaps the backshortening termination helped on shortness. wimmen-The mm due to assimilation of f to m. The long i is still heard. The form with u is due to the analogy of the singular, where the labialisation was not merely graphic but gave development. The w was written o between the w and m.

shariff—The i was shortened before two consonants. For lowering to e compare (shep)herd (A.S. saēp-hirde). The e of -herd is of course now sunk under obscure vowel (a). A similar lowering, due to lack of stress, is seen in M.E. here 'her' (A.S. hire).

woman—See women above. The short u of this word also had a development into (v). This sound is still to be heard.

(a) is the regular development. Aind—The a is excrescent (cp. Ihunh, sound). The n in the M.E. form is a difficulty. It is supposed to come from the gen. pla. Iii(wo)na, in such a combination as Ii(wo)na man *a man of the domestics. A new plural creation with n in nominative might arise out of this combination. A singular form in a would then actually access. In the The action.

form in n would then naturally appear. prist—The ending is due to analogy, compare ānes 'once.'

hiren—After the palalal vowel i, the g becomes i, and is

merged in the long vowel.

. iron—ir=(aie). The unaccented vowel is sometimes

written o-cp. rosespon, beacon (A.S. webpen, blacen).

sneah-Some dialectic form may be the parent of this

sound. Compare respons (Mercian, W.S. ripan) into resp.

spew—M.E. žu corresponds to A.S. žw, žow (W.S. žw).

It is written ew and us. Final French w was written ew and
the two spellings u(c) and ew thus got mixed. M.E. žw

corresponds to A.S. žw, žew. It is always written ew.

δ: A.S. ō corresponds to Teut. ō (O.H.G. uo, na, I.E. ā, ō). It also stands for several compensatory lengthenings of Teut. ο. In some words it answers to Teut. œ (Goth. ō, O.H.G. ā, I.E. ō)—nōṇa 'moon' Gk. uśm. A.S. ō was the long of o.

steward-long fir=(vue).

 \tilde{o} remained in Middle English, but passed in the Modern Period to long u, which is now diphthongised to (uu). This sound was shortened in certain words, especially before th and d, and has now passed to (v). Later on, another shortening took place, very generally before stopconsonants. This shortening, occurring after the passage of u to (v), has remained.

Words that derive from long close \bar{o} have oo in modern spelling, words that derive from long open \bar{g} have oa (o). There was confusion in spelling at an earlier date. Compare the use of ee and ea. For $\bar{o}a$ see under \bar{a} .

A.S. ō.

OO süfte adv. softe soft swür swor, swoor, swore flür flor floor sühle softe, sorte sought

moste has passed to (v) through shortened long w. A form with woccurs in Middle English. Perhaps it was due to labilisation, on the part of the w, exerted on an w shortened before two consonants. *doth—In Middle English, the \$\ilde{\epsilon}\$ of the \$\epsilon\$ forms prevailed over and expelled the \$\epsilon\$ form handed down from \$AS\$. \$\ilde{\epsilon}\$ Then followed the usual course of the long \$\sigma\$ that went to (v). The shortening took place first in the unemphatic position. *enough, *eng\(\vertic{\epsilon}\$ = In late Middle English \$\ilde{\epsilon}\$ in \$\sigma\$ in \$\sigma\$ horganitic \$u\$ before guttural \$\vertic{\epsilon}\$ had the pronunciation that was usually associated with the spelling \$\sigma\$_\epsilon\$, vis., long \$u\$. This was shortened in Modern English and went to (v).

-dou-The shortened vowel in the unstressed syllable has naturally passed to the obscure vowel (a).

wednesday-o has been shortened with usual confusion between we and wee, co. welkin.

bosour—In these words occurs the later shortening of u, which remained. to when unemphatic may be reduced to (e).

bisssom, folder—The o was shortened in Middle English before two consonants. Short o was opened in Middle English. It was lowered in Modern English to its present sound (e). shod—Compare for similar shortening rod the doublet of road (see below). hough—One would have expected hit to have followed the course of tith. Finally it has a A-sound. Formerly the final sound was that of tough showed, &c.—The long e-sound that these words, in com-

mon with enough, &c. (see above), had in Middle English, passed right on to the usual goal of long u, viz., (au). Compare the pronunciation of enough.

came—M.E. com comen is evidence that the A.S. vowel had been preserved. But on the analogy of nam, pret of niman, cam was substituted for com. A form cames would have its a lengthened (page 207). The preterite would then be levelled under the vowel of the singular and the vowel-length of the plural.

home.—The regular M.E. form must have been hab (with close a). This would now have given (un). The analogy of weare (A.S. wefan) introduced had as a preterite and histon as a participle. From the long open of the last our home has got the rowel it has developed regularly. The A.S. participle is haden which could only have given (et), behow ought to have gnd often does have the pronunciation of move, but the companitive infrequency of the word

tion of move, but the comparative infrequency of the word in ordinary speech has permitted the spelling to force the pronunciation. behoof (A.S. behöf) is regular.

row—M.E. õu A.S. õw (and M.E. õu, A.S. āw) regularly give (ou). woke should have been (uu) but has followed the analogy of the (ou) preterites.

(un) is the regular development of â. smethe.—This will come from the adjective smethe (i-unlaut of ô]. oose—The whas been dropped owing to a dislike to the sequence of the two cognate sounds, compare the provincial pronunciation of sooman, and the different remedy adopted under similar circumstances in the case of yet, yet (page 22), 1000f—The w is due to the influence of weave. A.S. ōmef is said to be for on-ungf 'that which is laid on the warp,' roof has also a wright read see their in this list. Jets. deren—The

M.E. drow, slow (long u) yielded to the influence of verbs of the know knew, grow grew class.

sware shews the analogy of bare (page 215). ār gives (8e). Compare swore below. moor—ār gives (ue). ore—Compare floor below.

Moor—The same result as moor has, might have been got, but in some words the nn was broadened to (so). moore—The long close o of the preterite gave place to the long open o of the participle moören. so/—The long o was shortened in Middle English before the two consonants. o was opened in Middle English. In the Modern Period lowering took place. The (o) thus got was in many words (page 232) lengthened and narrowed to (so). sōhte (brōhte, behird) was shortened in Anglo-Saxon. The short of bus got would have very much the same development as in soft, for the n was not pronounced in early Modern. Compare bought (page 232).

 \ddot{u} : A.S. \vec{v} represents Teut. \vec{v} (I.E. \vec{v}). Sometimes it is a compensatory lengthening of Teut. u.

A.S. \bar{u} was the long of u.

In Middle English, & remained. It might represent not only an original A.S. & but also the group-lengthened u that came down from Anglian. Both were other written ou.

in Modern English has had its first element diverged, unrounded, and widened in the direction of the initial sound of the present diphthons (sa).

The second element was widened and has taken more or less after the first element, retaining rounding. In some words the #sound has been retained, in others retained but shortened. When the shortening took place sufficiently early the result has been (%) (page 264).

		A.S. ū.

	stünian	stonnen	stoon

 $dust-\bar{u}$ was shortened before two consonants (page 200). The usual development of short u followed. thombe—The spelling with o is a proof of short u. ous—The emphatic form with long u has been displaced by the short unem-

phatic form. buten, buten, bute—This is the weak form, the conjunction; the adverb and preposition were strong, and had forms with ou. Certain of the $i\bar{i}$'s doubtless got shortened at the time when the $i\bar{i}$'s that came from M.E. \bar{o} were being shortened.

room, &c.—The sound is retained but shortened. could—
—The form with voiced consonant is weak and prevailed over the strong form with breath consonant. An I was introduced from should and sound. Lack of stress led to shortening, and I dropped out of the weak form as in the other verbs. The weak form holds the field.

grouelynge—Here we have shortening, with o for u. This o has followed the o-development. There was also a form with u which passed regularly to (u) a pronunciation that still survives.

pursdai—Shortening before two consonants appears here. ur gives (ee). furlong—There is also a M.E. form with o arguing shortness.

(au) is the regular development. $b\bar{u}$ is A.S. lengthening of Teut. u. buwen—g has become w after \bar{u} , cp. draw.

our—ür gives (aue).

uncouth—Long u is here retained, cp. youth (page 261). In

stoop the following labial has helped to keep the quality of

9: A.S. f is the i-umlant of Teut. ii, or of a compensatory lengthened Teut. ii. It may also represent the ie's that are the i-umlants of ās and āo (Teut. av and av). In Kentish, β became č, through lowering and unrounding. Hence f is sometimes written for ē (W.S. āc.)

In A.S. 9 was the long of y.

the vowel.

 \mathcal{I} was unrounded in Middle English into I and written i. It is also represented by \bar{u} (\bar{u}), and sometimes, according to French habits, by $u\bar{t}$.

In Modern English g follows mainly the development of \bar{i} .

		A.S. y.	
18	þrýsta (Norse)	prusten, thristen	thrust
i	(पुरार	fulfe, filthe	filh
	hýdde	hidde, y-hid	hid
	lÿtel	lutel, litel	little
ai	lÿs	lis, lys	lice
	cÿ pl.	kie, kye, kyn	kine
	hwŷ	hwi, whi	why
	drÿge	druie, drige, drie, dri	dry
	bÿcgan	buggen, biggen, bic, by	buy
ale	hÿran	huren, huyre, hyre	hire
	fÿr	fur, fuir, fir	fire
oi	bÿle	byle, bulle, bile	boil n

thrust— \bar{u} shortened before \underline{st} , with usual development of short u into (v).

fitth, &c.—shortening with usual course of short i. little— The A.S. word lost an ϵ in inflection. This gave two consonants after the \mathcal{G} . The plural, &c., thus acquired a short vowel which has prevailed throughout. The long vowel seems to have remained and developed regularly in the proper name Lyte (al). The pronunciation leattle is perhaps due to lowering and an ϵ -development—cp. ϵvil , A.S. yte (logge ϵ 39).

Orm writes the singular litell, the plural little. Compare hallow (page 242).

liac—The words in this list have followed the development of long i, which has been diphthongised to (at). kine is a double plund got by the addition of en, the levelled form of the A.S. plu, suffix an. The simple plural is seen in the Scotch kys, with similar diphthongal development. drize—Alter platal wowed [c, i] p becomes it and is merged after i. Of course the i here is already long. brigan (a pers. sing, bfycet), the fy-forms have given development, with the same course as in the previous word.

hire. &c.—ir gives (aia).

boil-M.E. bile on its road to (ai) had reached the stage (ai). The s here is the obscure vowel, mid-mixed-narrow. The verb boil had reached the same sound, for oi had passed through (ui) and (si) to (si). The two words (as soundgroups) were mixed. The spelling with of was established. and by and by drove the pronunciation into a reproduction of the spelling, in fact, restored the original sound. The sound is now (oi), and the verb and noun have the same sound in educated speech, though in the vulgar dialect, boil. the noun, has its own historical pronunciation. The word bile 'secretion of the liver' (Fr. bile) of course developed regularly into (at). Compare with boil vb. and boil n. (M.E. bile) the words toil and tile which once had the same pronunciation. But toil though its pronunciation was normalised did not as a sound-group carry with it tile, which went on to (ai).

For a lengthy number of pages the various developments of A.S. originals have been considered. It will now be requisite to put down the wire verse and trace back each modern development to its principal A.S. originals. This must be done briefly. Actual words illustrating the changes referred to below will be found under the A.S. letters.

whas been got from A.S. u, ū, y, ō.
i has been got from A.S. i, y, ī, ŷ.
e has been got from A.S. a, e, o, ā, a, ē.
a has been got from A.S. a (a, ea), ā.
a has been got from A.S. a, ō.

so has been got from A.S. or, al (æl, eal), ag, war

(wear), o (+f, s, th), ont, int (ant), aw.

. Some remarks were made on these modern developments on pages 197 and 198.

A passing reference to words of Anglo-French origin must suffice. The sounds in these words shared the fate of the similar sounds that existed in the developed Anglo-Saxon of their date. I say developed because certain Anglo-Saxon sounds had undergone changes. \hat{e} and \hat{e} and had given \hat{f} (long open \hat{e}); \hat{e} had given \hat{f} (long open \hat{e}); \hat{s} had \hat{e} had become open sounds; and f had be vocalised to i and u. Long French ii was levelled under the eu that had been got from A.S. ēaw, &c.

The following three lines will go to illustrate the similarity in development alluded to above. Line x denotes the sounds of the developed Anglo-Saxon; line z contains words of native origin that have developed these sounds; line 3 contains words of Anglo-French origin that have developed the same sounds. The words of native origin are taken from the vowel lists where they may be found with the help of the index.

- 1. a å g g ö i i o g
 2. man scale ferry east geese bill by on oak
- 3. ban bale peril beast degree bill cry honour cloak.
 (measure)

 1. ô ti , ti si ei au eu
- s. stool run mouse day way draw dew
- fool plunge spouse delay veil cause beauty buil (edict)

beart and foot had originally short vowels in Anglo-French., No comparison of the ot-sound can be given. It does not occur in words of native origin. For boil see page 270. And the ow-sound had lost its diphthongic character in Anglo-French, and had become a symbol for the long w-sound, being used as such in Middle English.

It is worth while noticing how the Anglo - Saxonoriginals of these sounds have fared in Scotch. Modern Scotch (not Scotch-English) is really latter-day Northumbrian. It has had a distinct development of its own in. which sounds have changed pretty uniformly, subject to comparatively little deflection produced by their surroundings, save that caused by a following g or h. r is always the point-trill and has had nothing like the influence it has had in English. The alterations it effects are chiefly quantitative, not so often qualitative. It ought to be added that Scotch is more retentive of vowel quality than English. For example, the shortened i in sich is wide in English, but narrow, like its original long in Scotch. Indeed, the long

i-sound is now wide in English. Here follow, with Murray's spellings, Scotch examples of the Anglo-Saxon originals.

Scotch.

A.S.

āw

man (L b. w.) ā and ā steane and neame (h. f. w. + m. f. w.) mæn (l.f. w.) eist (h. f. n.) Ãa. feit (h. f. n.) i and y blynd and hyll (m. f. w.) weyfe (m. f. w. + h. f. n.) ī on (m. b. w. r.) stuil (m. f. n. r.) grund (m. b. n.) 11 mooss (h. b. n. r.) day (m. f. n.) waiy (m. f. n. + h. f. n.), or as in day draa (l. b. w., long) deuw and bleuw (m. f. n. r+h. b. n. r., before a cons., as in stuil).

growe (m. b. w. r. + h. b. n. r.) blaz (l. b. w., long) Note that blind and ground have not been grouplengthened in Scotch.

A.S. ā was not rounded in Scotch but along with lengthened a (before consonant + vowel) passed to present sound. A.S. āw levelled under āw in English has had the same result as ag in Scotch—cp. åraa and blāa (A.S. åragan and blāavan). ar in Scotch has two values. Thus boyl in the South has the sound of mid-back-wide-round followed by high-front-narrow; boyle in the centre and north has the sound of mid-front-wide and high-front-narrow.

A few examples of noticeable Southern Scotch developments of A.S. sounds before gutturals will not be out of place. In this dialect the guttural after back vowels is labialised (cp. G. auch), after front vowels it is palatalised. In the other dialects occurs the ordinary guttural with occasionally a different vowel-sound. After a high-frontnarrow and a high-back-narrow-round a simple guttural also occurred in Southern Scotch.

From ah—curacht (l. b. w. + h. b. n. r., A.S. āhht), ah. '
—leawch 'low' (m. f. n., long) and leawch; from seh—feycht (l. f. w.), eah—cycht; from th—nycht (m. f. w.); from th—desechter (m. b. w.), oh—coucht; from th also leawch 'laughed' (m. f. n. r., A.S. hloh); from th—runch 'rough' (m. b. n.).

eag.—Scotch ey 'eye' has in south the value mid-frontwide + high-front-narrow, in other dialects it is written ee, and has the value high-front-narrow (long).

"ug—buw" bend' with value mid-back-narrow + high-backnarrow-round in south, elsewhere it has the value high-backnarrow-round.

3g-drye with value low-back-wide+high-front-narrow.

The sound heard here is the nearest Scotch equivalent to English long i.

Anglo-Saxon consonants, their passage to, and representation in, Modern English, will now be the subject of some remarks.

b: A.S. b occurs initially. Medially and finally it appears geminated, or in the group mb.

In the present language A.S. & appears as \$b-bind, damb, web (bindam, dumb, web\$ (Fett b)); as \$p-gustip (god-sibb). \$p occurs in unkempt for unkembed (equblan 'to comb,' umlaut from camb (Gk. \$\gamma\text{inph}\text{inp

Our b, like the Anglo-Saxon letter, is the lip-stop-voice.

For developed b see under m.

Modern French.

c: A.S. c had two values, back-stop and front-stop. It remained back before back vowels and umlauted vowels (and before consonants)—a(p), ρ, μ, ā (Teut. a), δ, μ, α (umlaut of ā = Teut. a); ε, μ, α (umlaut of ρ), β, ε (δ), but was fronted before all vowels that were front before mutation began. This is apparent from the Modern English words

togain. The support from A.S. initial c. From back e-care, come, coal, coal, coal, key, kix, keen, clean (carn, caman, coi, cii, cii, ciege, cyxan, cine(ii), clâne). This e was in Middle English sometimes written c, sometimes k (page 190). From front e-chin, churt, check (clinn, coort, cocc). In Anglo-Saxon, front e-was represented by e, but at the Norman Conquest, it was, according to French (Central French) fashion represented by e, by at the sound of ch in child.

In French, this sound developed into the shound of

Final c is represented by k—ark (earc). Final α (sometimes c) is represented by ck—ack ($c\alpha\alpha$). $c\omega$ was displaced by French qu—queen ($c\omega\bar{e}n$).

When e followed front vowels, ch was often developed through influence of inflectional front-rowel e-which, such, pitch (huile, suyle, pic). The spelling of the last word leads one to notice that teh (M.E. cch, chch) is the regular representative of doubled e-flitch (flice).

This sound is regularly written of after long vowels coach, teach (the(e)an). After a short vowel to often occurs —pitch, ditch (dic), but sometimes ch—rich, much, &c. After a consonant, ch is written—quench (amergan), which, ruch. In these two last the consonant i is now lost.

ch is sometimes voiced into a j-sound—knowledge (M.E. knowleche), (Green)wich. It is written j in ajar (M.E. on

char, A.S. on, cerr).

ch has disappeared in I, every, barley, lent, made, drown
(ic. afre. alc. barlic, lenden, macode).

A.S. se is usually sh (M.E. sch) in the present language —shake (sc(e)acan), fresh (ferse), but occasionally sh (by. form in ks, x)—ash (prov. ax). Note also mussel (A.S. musele).

nusset.

It should be noticed that Northern forms exhibit k for Southern ch. Compare kirk and church, seek and beseech.

The k in kn is now no longer sounded.

The fronted k that is heard in provincial English (and in American) in words like cart is an effect that, was produced by the previous stage of (az) viz., the front (see) (p. 214). Compare under g.

The present hard c is the back-stop-breath.

The word ache might have been noticed above. There

was an A.S. verb acan which gave in Middle English aken, and an A.S. noun ce which gave in Middle English acke. The modern word is a blending of the vowel of the verb and (as far as form goes) the ch of the noun. The noun acke once had the ch-sound.

d: In Anglo-Saxon and Middle English instances occur of the loss of sonancy that is seen in our dwelt for dwelled.

Of course A.S. d appears now as d. It also appears as 1-rifl, mont, leant, till 'canvas covering' (rassed, genunod, hibadd, tild); and as the (voiced), when preceded by a vowel and followed by r-father, mother, gather, weather, hither (fader, modor, gedrian, souter, hider).

Assimilation occurs in winnow, gossif (windwian, godsib).

Ana disappeared in tine 'tooth of a harrow,' line, weedine,
swanies, assers, gesfel, (tind, lind, wusdahid, formerly
waniand (wane, part. taken for noun), gadswaru, godsjell).

nphalisterer was once uphaldster. Notice iron mould, once
yron-mole (A.S. mål 'spot'), and newfangled, once newglangel (A.S. fon (fangan 'to catch')).

In words like verdure, the d+y-sound has with some speakers passed into a d+voiced sh-sound. Compare she and sure (page 290). See also under t. A d-sound is disappearing in words like singe.

Our d, like the Anglo-Saxon letter, is the point-stop-voice.

5: A.S. ŏ between vowels or vocalic sounds was voiced. Initially, there was probably a voiced as well as a voiceles variety. Finally, it was, in West-Saxon, probably voiced. In the combinations of a co. ŏ. the ŏ passes to t. d is assimilated. The results are # and st. Js usually passes to ss. The Gothic b was voiceless in all positions.

In the Southern dialect of Middle English this letter was voiced. In the Midland and Northern dialects there was an initial and final breath sound possibly inherited from the Anglian.

As to the orthography, p gradually ousted 5, being itself replaced, in French fashion, by th.

To the voiced sounds in the present weak the, that, they, then, there, though, and with, there were opposed in Middle English the breath sounds of strong forms.

In Scotch the th of though and with is a breath sound.

In the present language th when initial except in the above words is a breath sound. Finally, it is also breathed (except in with, and the vbs., month, bequeath, smooth)—leath.

breath, bath. To these are opposed the voiced sounds in loaths, brathe, bathe. The voiced sound is due to the fact that these words were intervoile in Middle English. In certain plurals in the the is said to be voiced (not in Scotch)—baths, tolks, mouths, truths, naths, faths, twenths. The th of some words, owing to a weathering of

terminations, is now final, with consequent change from

voice the to breath the—carth, hencath.

A.S. 5 is of course represented by the in Modern English.

It is also represented by t—statucart, lent, sight, cynt, nastril,
husting(s) (strictwier5e, 5) het 5e, gesih5, igu5, nas5ryt, hār5ing); and by d—con(y) (vi5c) (see A.S. 10). It is after r,
and before r and l, that d usually appears—harten, nurder,
afford, spider (M.E. spither), rudder, swoaddle, fiddle (byrSen,
myrSrun, (cr)/britan, spi5re, ribor, swicel, fiotel). For examples of assimilation take liston (lithe-sour). Surry,

Sursex, Suffolk (tibe, Silvrige, Silv-Seazan, Silv-folt). It has also dropped—urrit, worship, Norwich, sin(ec), or (wrist for writist, from writish, worskip, Novibul, silven, ähmeder). Note wrath and moth (wraddo, modde). The theomat has, as in Anglo-Saxon, two values, the point-teethopen-voice.

f. A.S. f represents Teut. f and n. It was voiced between vowels, and after r or l followed by a vowel. Probably it was also voiced finally, and perhaps initially, except in the Northern dialect. This seems to be Sweet's conclusion. Sievers speaks of initial surdness. f in Gothic was a breathed letter. It was b there that medially after vowels had the sound of n. f was and would remain

In the Southern dialect of Middle English / was voiced. It was written or initially, and medially, but not finally, because confusion with vocalic u would have ensued. To avoid confusion / is also written before voiced letters. French words, however, being introduced later, kept their breathed /.

breathed in combinations like fs. ft. ff.

In the Midland and Northern dialects there was an initial and final breath £ possibly inherited from the Anglian.

The present voicing and breathing in weak of and strong of (both A.S. of) would naturally exist in Middle English. If is now pronounced everywhere when written, even between vowels, as in wife and life. Of and its compounds, where of, &c., are exceptions. Certain words that had v in Middle English we now write with f—belief, therif.

A.S. f appears in Modern English as f—father, deaf, wolf, fifty, chafer (fæder, deaf, wulf, fiftig, ceafor; as ff—staff (staf); as v (between vowels very common)—cove, raven,

harvest, wolves (cōfa, hræfn, hærfest, wnifas). In Northern Scotch the f-sound is to be heard in certain intervocalic plurals—wyffis.

Only a few words appear in English with Southern initial v—vane, vat, vixen, vinewed 'mouldy' (fana, fat, fyxen, ffnegod, p. p. of ffnegian 'to become mouldy').

For examples of vocalisation take havel, never (page 222), anger (hafoe, efete, nafogār). f has been assimilated in lammas (hāfimasse). It has been dropt in lord, hady, head, anent, anthem, stem (hlāford, hlāfdige, hāafod, on efen, anthefu, stefu (stemn)).

Our f is, as was the A.S. voiceless f, the lip-teeth-openbreath.

g: As in the case of c, A.S. g was kept a back consonant before back and unlaut vowels (and before consonants) but fronted before vowels that were front before unlaut operated. This is proved by the spelling of the following modern words deriving from A.S. initial g. From back g—gold, goat, gild, geax, gild, geax, glad (gold, gāt, gyldan, gēs (ê), glæd). From front g—yield, yarn, yellow (geldan, garn, garn, gachn). Many modern words have g where y was to be expected. This is due to the fact that they are Norse words—girth; or Northern forms—give (Ch. yiben), get; of to the fact that the back g of other forms has ousted the front g—begin (with g from begann). Different vowels in cognate forms may also yield different results—gate from A.S. plu: gatn, yate (Northern) from A.S. sing get.

Note also, the representation of hard g by gu and gh, as in guest and ghost.

The back stop occurred finally in ng. This is borne out by modern words—sing, long (A.S. singan, lang (9)). Also

in g after unmutated vowels froga 'frog,' doga' dog.' But when ng or og (doubled g=Teut, gf) was preceded by an unlaut vowel the g was front-stop, as in A.S. sgngan, bryig. The ng and og have here developed into the sounds heard in modern singe and bridge.

According to Sweet A.S. g represented four sounds, two stop and two open, with a back and front variety in each. Sievers holds that A.S. g was an open rather than a stop sonant. Teut. j was levelled under open g.

Initially, in Anglo-Saxon, g was either the open or stop variety. Unlinital g was an open consonant either front or back; front-open before Teut. i, j-folgian, and when an open g after a front vowel was final or followed by a front vowel—dags, dags; back-open when preceded by a back vowel (r or I may come-between) either finally or medially—Irog, genāg, burg. This g was later on unvoiced to h. It was also back-open though preceded by a front vowel, if a back vowel followed. Front-open and back-open g were often assimilated by succeeding breaths and written h. They are dropped after front vowels when followed by the voice letters \$\tilde{0}\$, \$\tilde{0}\$, \$\tilde{0}\$-adde for sagale. Front g is dropped in \tilde{0}\$-attentional for stigwent of stigwent.

In Middle English, front g became everywhere 3—we now write y—except in g and g preceded by unlaut vowel, e.g., M.E. singen, briggs (A.S. singen, brygs). The symbol g was used to denote the sound heard in these words. g of course represented the stop g. French soft g was also written g, but when initial usually j. In the Ormulum, back-open g was written gh.

Initial 5 (Teut, j') has dropped off (sometimes in Middle English) — (ic)ide, if, itch (A.S. (is)gicel, gif, gice(e)an).

Initial 5 (Teut. g) has sometimes had the same fateenough (M.E. inōh, A.S. genōh), yclept (gecleopod). Compare handiwork (handgeweort).

Examples of the vocalisation of g after vowels have occured in the vowel lists. By way of recapitulation one example will now be given of each occurrence.

A.S.	Mod. E.	Examples.
ag	T.W	saw (sagu)
æg eg	ai, ay	slain, rain, may (slægen, regen, mæg)
ig	i, y, ey	nine, many, honey (nigon, manig, hun
Уg	ye, ie	rye, tie (ryge, tyge)
og	OW	bow (boga)
ug	OW	sow (sugu)
äg	OW	own (āgen)
æg	ay, ey, ei	clay, grey, neigh (clag, grag, hnagan)
eag	ye,	eye, lye (čage, lčag)
ēog	ie, y	lie, fly (leogan, fleogan)
ig	ic, i	hie, friday (higian, frige:dæg)
ōg	00	won (wōgiau)
üg	ow.	bow (bilgan)
ĴВ	y	dry (drÿge)

Note also the vocalisation of g after r-morrow (A.S. morgen).

Note also the transformation of g in these—henchmani (A.S. hengest-mann 'horseman'), orchard (A.S. ort-geard).

g before n is not now sounded.

The fronted g that is heard in provincial English (and in American) in words like graden is an effect that was produced by the previous stage of (as), viz., the front (as) (p. 214). Compare under c. The present hard g is the back-stop-voice.

h: A.S. & had three values-throat-open, back-open, front-

open. Initially and medially before a vowel it was a mere breath. Medially and finally it was the back-open or front-open according as a guttural or palatal vowel preceded. Before 'in h'it was the front-open (see Chap. VIII., under f). In Middle English, it dropped from weak (h)i'i in the Midland and Northern dialects. It was also dropped in initial

and and Northern malects. It was also tropped in initial hr, hl, hn. hw was kept and sometimes written wh (lipback-open). In the North it became the rounded backopen, a sort of labialised guttural. This was written guht (an).

Medially and finally, it was in Middle English either the rounded back-open, or the front-open, according to the character of the preceding vowel. In writing it was expressed by h, s, and finally by gh (page 192). On the addition of an e, h became ex.

In the Modern Period, initial h was dropped very generally in speech, but its retention in writing, and the influence of Scotch and Irish speakers of English have led to its resuscitation in speech. It is even now sounded in many French words where it was originally mute. Medially and finally, it has now either the sound of f, or is mute.

A.S. h appears in Modern English as h-hill (A.S. hyll),
-cc.; as wh (when s follows)--whole (A.S. hāl). Medially
and finally, it appears as f-might, brought, taught, tengl,
-laughter, dwarf (niht, brohte, tehte, töh, hleahter, dwarfs).
Most of these have been mentioned in the vowel-lists, and
may be found from the index.

A.S. hr, hl, hn appear as r, l, n, in their modern descendants—rine, lord, nit (hrim, hlifprd, hnitu). A.S. hw appears as wh.—who (hwa). Initial wh is not always to be carried back to hw. For example whit and whelk are to be

referred to A.S. witt and wile. Notice the disappearance of h in fee, lea, not (nonght), wassail (feeh, leah, näht, weshel).

Our & is the throat-open-breath.

1: A.S. / disappears in many words—much, such, each, which, wench, bad, England, spet (myad, such, alc, hwile, wench, badd sb. 'effeminatus,' Engls-ipnd, splot). An intrustoe d appears between I and r in alder (air). I is now dropped in the pronunciation of many words—half, calf, walf, both. whold. would. &c.

Our i is, like the Anglo-Saxon letter, the point-side-voice.

m: Λ δ (now silent) attaches itself to this letter—thumb,
crumb, munb, timb (Süma, cruma, genumen, lim). Between
m and l, m and r, a δ is commonly developed—thimble,
shamble(s), slumber (Symel, scamol 'stool,' slimerian). Λ p
also sometimes appears between m and t—emphy (ēmtig).
Compare glimpe (M. E. glimsen).

Notice ant from anne (A.S. amete), and compare account from accompte. Emmet also occurs.

Our m is, like the A.S. m, the lip-nasal-voice.

n: A.S. n has disappeared in these—game, holly, penny, mistlete, eteron (gamen, holdy)n, pening, mistletin, end-lafon). Compare anger and addre which have both lost initial n (neddre, nafogár). A d sometimes attaches itself to this letter—lend, pound, round 'whisper,' bound 'ready to go,' horehound (hearhound) (leann, primien, rinien, Norse binn, hārrhim). This sound is developed between and r, n and t—thunder, kindred, spindle, dwindle (Gunor, cynraden, spinol, dwinan).

For examples of assimilation take dross, ell (dross, eln).

n is intrusive in nightingale (A.S. nihte gen., gale 'singer')...

Compare messenger, passenger. bittern had no n in Middle English (bitour). It is French in origin. The n in newt (A.S. felt) and nichname (an ekename) has got attached in the sentence life of the words, and comes from the article an. Compare none where the n comes from the dative of definite article (A.S. $\delta \tilde{a} m$, $(\delta \tilde{a} n)$). Chaucer has for the nones.

Note wimple (A.S. winpel), hemp (A.S. hanep). Peri-winkle 'winkle ' is from A.S. pinewincla.

Our n is, like the A.S. n, the point-nasal-voice.

p: Besides appearing as p, A.S. p appears as b—lobster, pebble, cob(cueb) (loppeare, papel, āltor-coppe (A.E. attercop' spider'). The last word is to be heard in Scotch as netter-cap, with inorganic n, as in newt.

For example of assimilation take chaffer, a verb formed from a substantive (M.E. chaffare, A.S. céap 'purchase, faru 'journey').

Our p, like the Anglo-Saxon letter, is the lip-stop-breath.

For developed p see under no.

r: A.S. r was a full point-open-voice as in Scotch. In the commentary on the vowel lists the effect of r on preceding vowels has often been alluded to. It has been seen that even in Middle English it broadened vowels into a. It is a sound that has always favoured the generation of vowel sounds before it. Compare the Anglo-Saxon breaking before r+ consonant. Later on, in the Modern Period, e, f, of followed by r were levelled by its influence under obscure vowel s. Long vowels, too, suffered broadening.

In the present Standard language, r, except before a vowel,

is a mere voice-glide. As such it is heard finally, and before a consonant. Even this is sometimes merged in the preceding vowel.

A.S. r often suffers metathesis. Many instances have appeared in the vowel-lists. Additional examples are grass, cress, fresh, wright, third (gers, crese, ferse, wyrhta, 3ridda).

It has disappeared in speak speech (A.S. sprecan, sprace later specan, space).

r is inserted in bridegroom (A.S. brjd-guma), paddock is from A.S. pearroe 'park,' bass (the fish) from

A.S. bærs.

8: A.S. s between vowels or vocalic sounds was voiced.

Initially, there was probably fluctation. Finally, it was probably voiced in West-Saxon. Naturally it was and would remain a breath-sound in combinations like st, ss, &c. The Gothic s was voiceless.

In Middle English, s was voiced in all positions in the Southern dialect. When initial, and before a vowel, it was written s in certain texts. Sometimes, medially and finally, s was written, but generally s represented the voiced as well as the voicedess letter. The s of French words was not voiced. The voicing was over. These would reinforce the hissed s.

ss was sometimes, owing to French influence, written ss.
And later on in Middle English, ee was, after French habits,
used to denote a final hissed s. In the Modern Period sr
in some words replaced s initially—in seeut, scite, scituation
and in the native soythe. It has remained in the first and
last words.

In Middle English there would exist strong hissed forms of is, his, was, has, along with the then developing and now prevalent weak buzzed forms.

In the Midland and Northern dialects there was an initial and final breath s. possibly inherited from the Anglian.

In Modern English initial s has always the hissed sound. Plural s, and the s in weak syllables generally (unless following surd letters) have buzzed sounds. Emphatic monosyllables like gees have a hissed s. Compare the hiss heard in the substantives house mours, with the buzz heard in the verbs house and mouse. When house is made into plural houses the first s becomes buzzed. Not so in Scotch. There the plural has its first s a hiss, as in the singular. The second s is of course a buzz.

The buzzed sound of needial and final s is not always indicated by the spelling. This is done in subsess, freese, hastel, &c. Compare the alternation of buzz and hiss in grass and grass, branen and brass, glass and glass. glasser has had its buzz fronted to voiced sh. rise and choose have a buzzed to

The s here was intervocalic. ross and chose have also the buzzed letter. The s here was final in Middle English. The infinitives helped them to the buzz. The s in wise (A.S. wis) is buzzed. The s would be intervocalin in the inflectional forms. In Scotch, wise has a hissed s.

Notice the buzz and hiss in words like exert and exercise. In the first the s comes between an unaccented and an accented vowel, in the second between an accented and unaccented.

A.S. s appears in Modern English as s-sun, thirst, kiss (sunne, byrst, cyssan); as ce-ice, mince, mice (is, minsian, mys);

as z—adaz, hazel, diray (adaz, hazel, dyizj); as ch—linch-(pin) (lynes *azle-tree'); as zh—zhe (zin). A.S. zio in its weak form shifted stress to second element. The z with the indistinct first element of the diphthong passed to zj and then to zh-sound. She takes its present shape and sound from a blending of the initial consonant of the weak form with the vowel of the strong. Compare the modern change of z in sure into zh-sound.

ss has become s in adns (A.S. edmess). adms is a singular like earer (A.S. efes). Contrast bodies which really is a plural, equalling bodies. st has given ss in blessom (A.S. blöstm). s has sometimes changed places with the preceding consonant—mossp, hasp (A.S. swaps, haspsc). s drops in some words—burial, riddle, paddle (A.S. byrgis, riddle, spadu). Pen is a manufactured singular from M.E. pen (later pens) (A.S. pita, I. pissum). s has been foisted into tilaged (M.E. iland, A.S. igland) from the analogy of the French iste. Notice (be)best and hearse (A.S. hät, hät).

Our hissed s is, like the A.S. bissed s, the blade-open-breath.

t: A.S. t, besides appearing as t, sometimes shews voicing-proud, pride (prilt, prilt). It also appears as thswarth(y), anthem (sweart, antefu). lath is from A.S. lett.

bless (A.S. blētsian, umlaut from blōd) is an example of assimilation.

t has disappeared in these—anvil, gorse, best, last, Essex, Sussex (anfilte, gorst, betst, latost, East-Seaxan, West-Seaxan). Compare ado for at-do.

t is often attached to words in s, perhaps owing to the in-

fluence of the termination st—against, amongst, whilst, (whites), behast, earnest sb. (M.E. ernes). The s in against, &c., is an adverbial suffix representing an original genitive case. It is also attached in anent (A.S. anefn).

In words like *nature*, the t+y-sound has with some speakers passed to t+sh-sound. See under d.

t when preceded by s and f, and followed by l, n, m, is dropped in pronunciation (not always in Scotch)—castle, fasten, christmas. In words like milch and bench, the t-sound is being droot.

Our f is, like the A.S. f, the point-stop-breath.

w: A.S. w, when final, is after consonants often vocalised to u(o)—woln. It is vocalised and forms a diphthong with the preceding originally short vowel—trie new. The w is here often added, taken as it is from the oblique cases. we and wa after I and r appear in Modern English as ow—mallow, yellow, arrows, sparrow (novalwe, geolow plus, arc), sparrow (novalwe, geolow plus, sparrow).

whas disappeared in oxic, root vb., lith, lark, thong, fret, so (wös, wröian (wröi 'snout'), wijip adj., läwere, bwong, fretwan, swä). The win answer, sword, though written, is not pronounced. In answer, the wis in the unaccented syllable. win the combination wr is now silent. The combination wh has in Southern English the same sound at w.

In Modern English, as in Anglo-Saxon, w is the lip-backopen-voice.

x: A.S. x remains -axe (ax).

INDEX

(The numbers refer to pages. Only the Greek, Latin, Anglo-Saxon, English, and German words have been indexed. The English words occurring in Chapters VIII. and IX. have a separate index.)
